15.1. Helpdesk Team 184
15.2. Helpdesk Overview 185

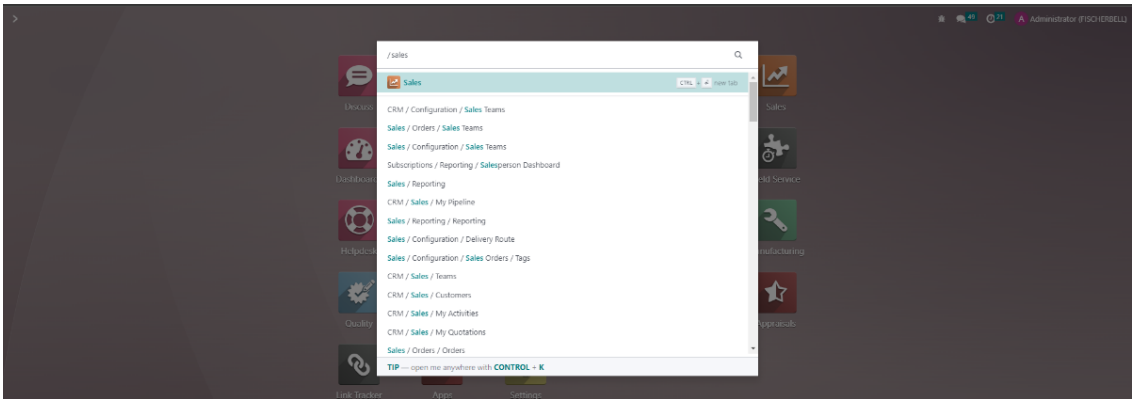
15.3. Create Quotation on site 186
15.4. Recurring Task 187

1. Core

1.1 General

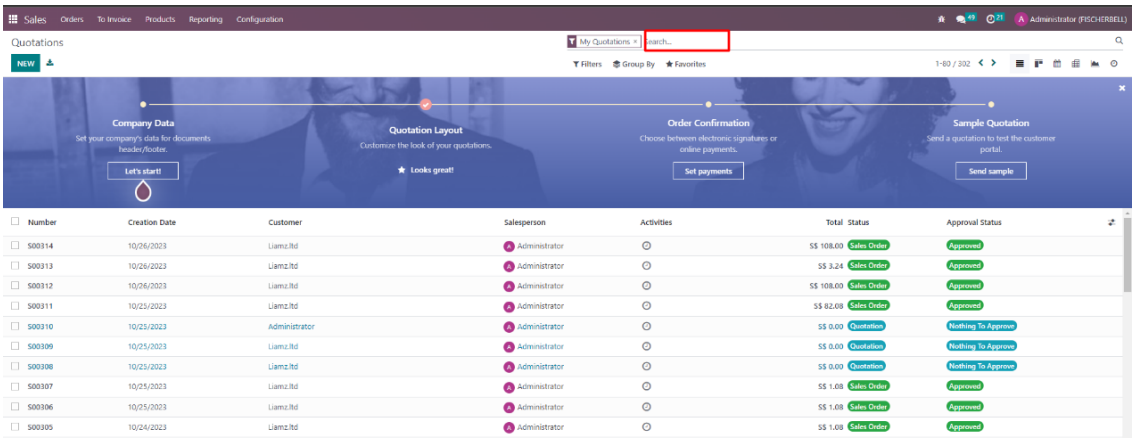
This will be the Main Dashboard, this is where we can see all the Modules exist in the System. On the Top Right you can see the current login user (Which is Administrator)

1.2 Search

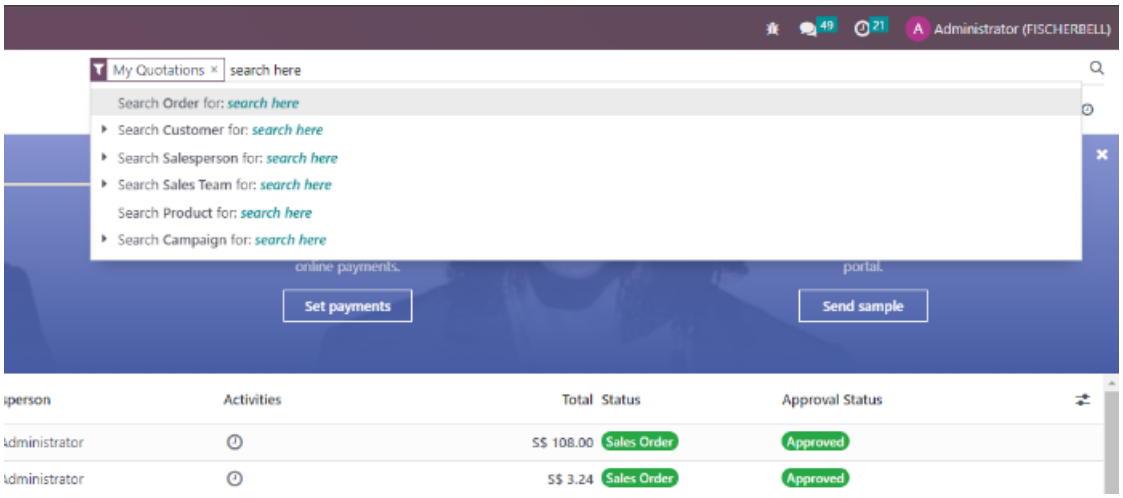


On the Main Dashboard you can also search modules and menu related to the modules by typing the modules or menu while you are on the Main Dashboard.

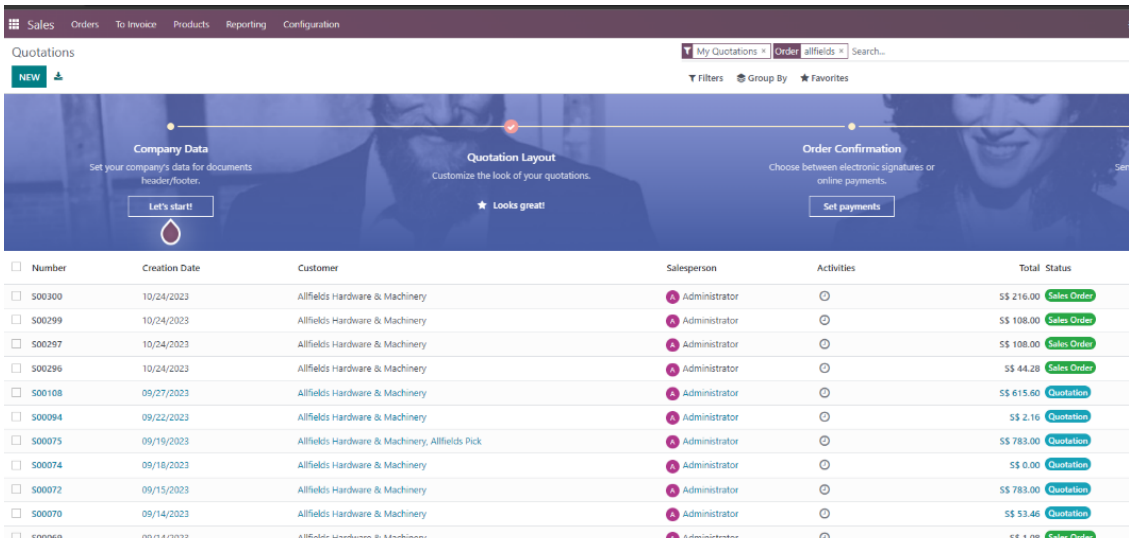
1.3 Filter



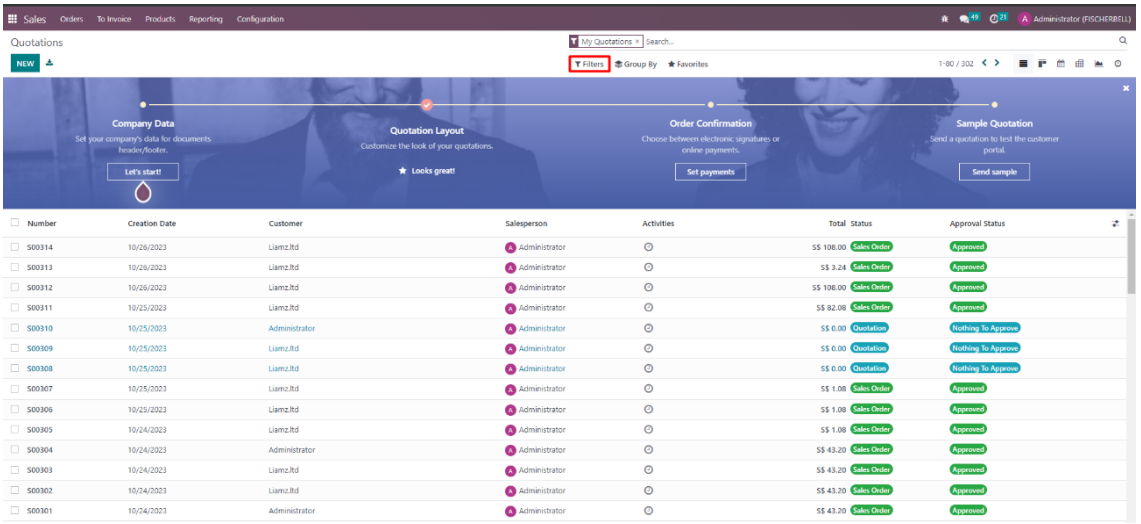
The system also provides the function to filter data. For example, right here we are on the Quotation View Data, and you can see all the data. On the top right you can see the red outline box, there we can search for the data we want and we can click on the input.



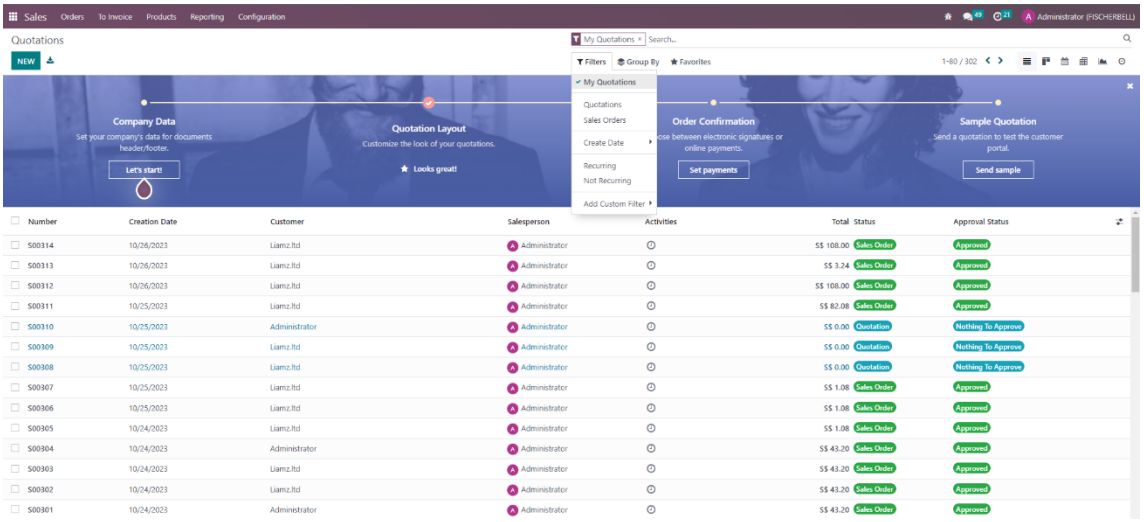
On type you can see all the default search listed below, so for example we want to search Quotation Data which the Customer is 3-D Prototype Pte Ltd then we can type the name in the search input then click on the **Search Customer for {name}.**



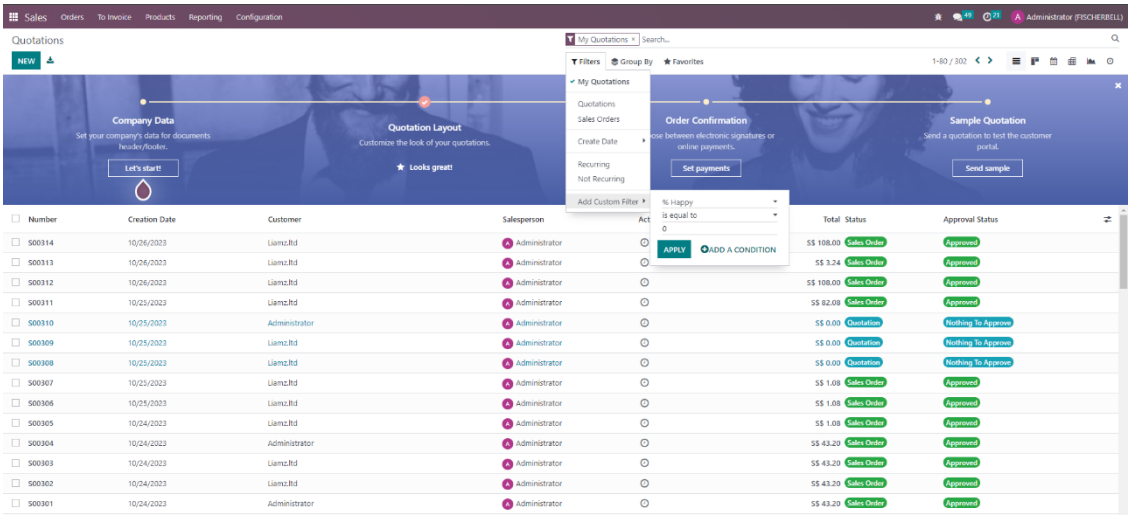
On click you can see on the search input the **Customer 3-D**, which means the system will only show Quotation in which the Customer has the name 3-D. Below you can see the data have been filtered.



We can also use the Filter Button below the Search Input, we can click the Filters button

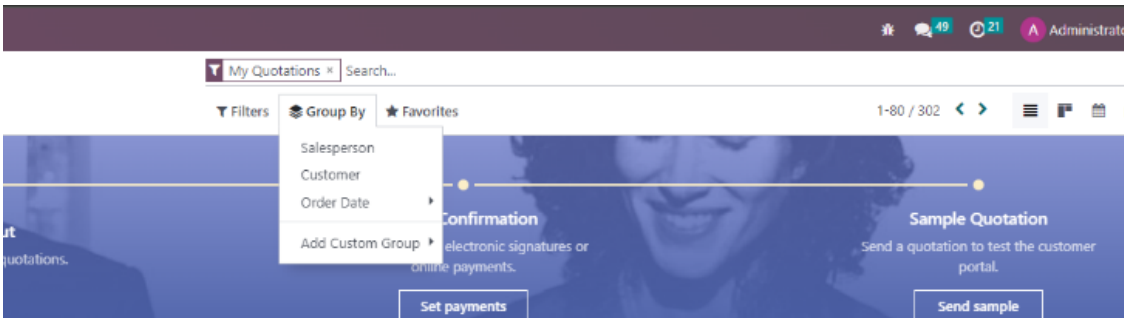


On Click, we can see the default filter like My Quotations, Quotations, Sales Orders, and Create Date. The Check on the left side of the default filter means it is currently active right now. To set the filter we can just click the default filter.

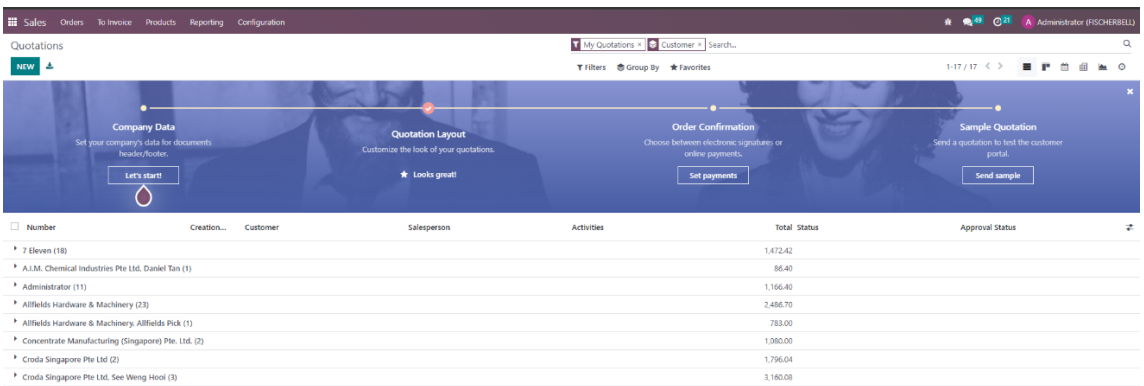


There is also **Add Custom Filter** which is a Custom Filter that we can create manually the way we wanted. When clicked then another box will be shown, the first input will be the parameter we set for the filter after that will be the value of the parameter we want to filter

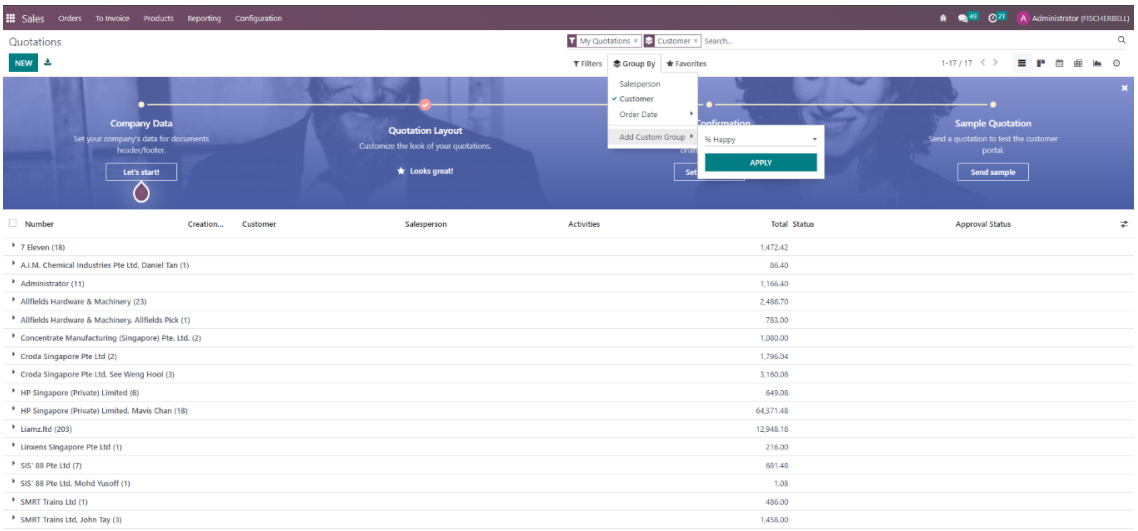
1.4 Group



After Filter there is also **Group By**, this function to group the data based on the selected parameter value. In the image above we can see the default filter which is Salesperson, Customer, and Order Date. For example, we can click the Customer

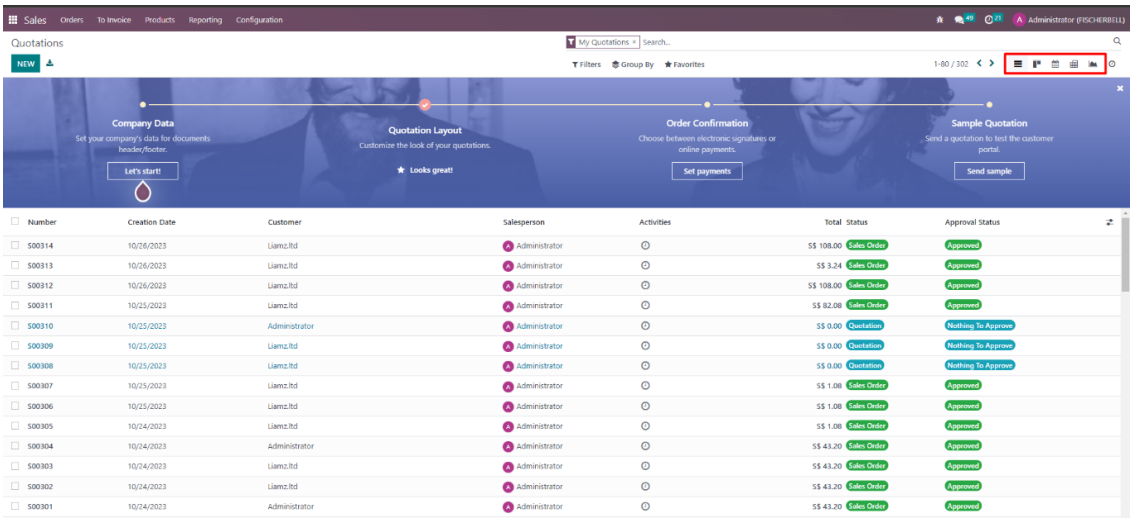


Here you can see now the data has been grouped by Customer.

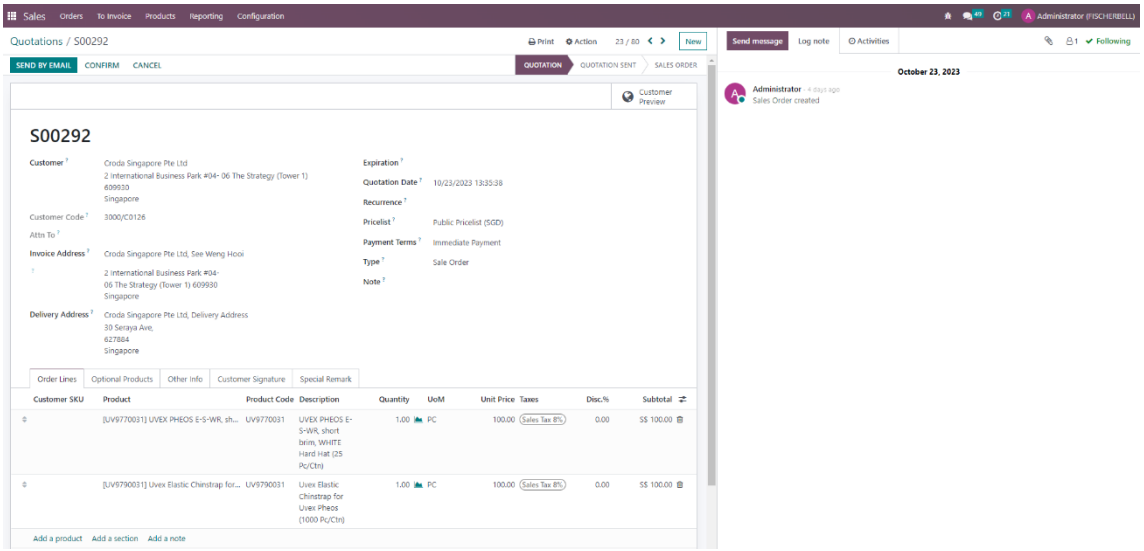


Same with Filter we can also make a Custom “Group By” by selecting the **Add Custom Group** then we can select the parameter we wanted to choose.

1.5 Views



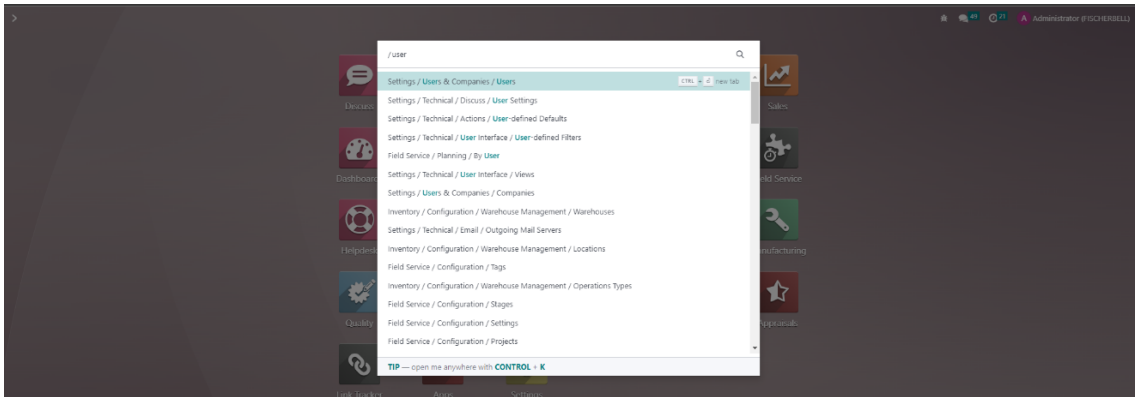
In the system there are multiple views. The current view we are looking at is called **List View**. We can change the view by selecting the Icon on the top right, but the main view we will be focusing on is List View and **Form View**. Form View is the view when we select one of the data.



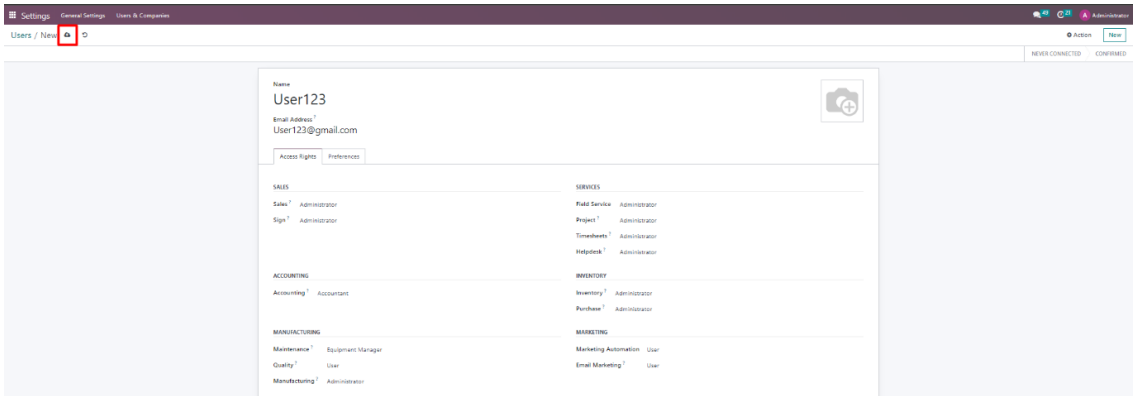
This is the **Form View**.

2. User [Administrator only Please submit a Request to McCoy for new users]

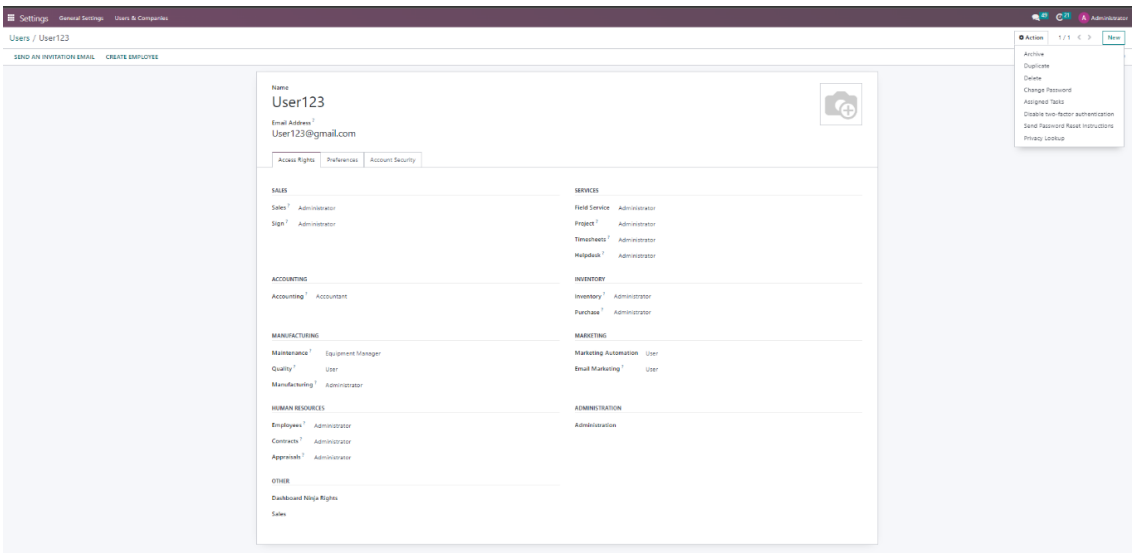
2.1 User



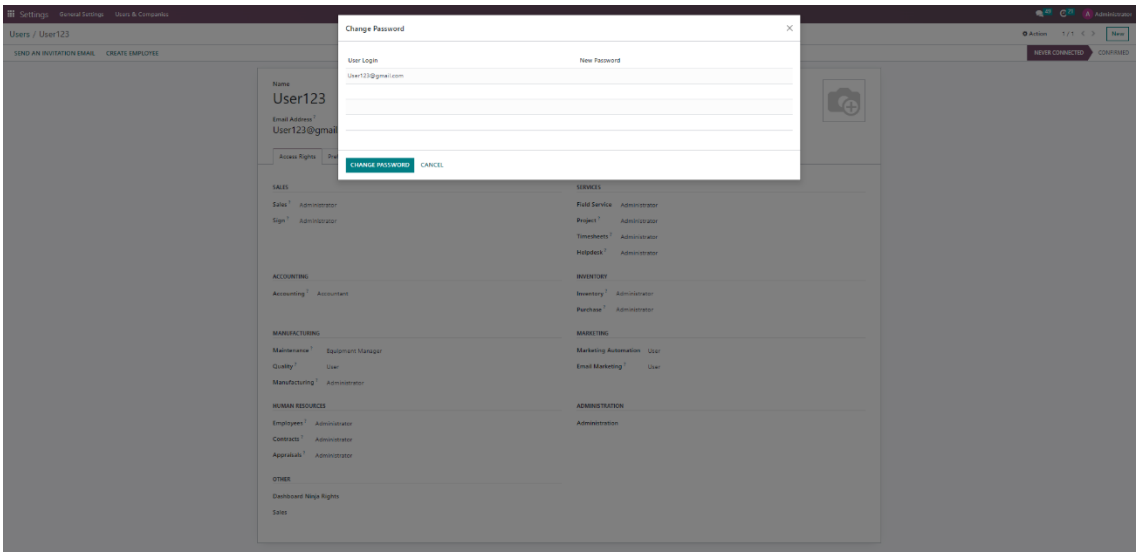
From the Main Dashboard, we can type user and we can click on the **Settings/Users & Companies/Users Here** we can see all the Users. To create a new new one, we can click the Create Button



On Clicked, we can set the Username and the User email and after that, we can click the save button



For the password we can click the Action button, then after that, we click the **Change Password**.

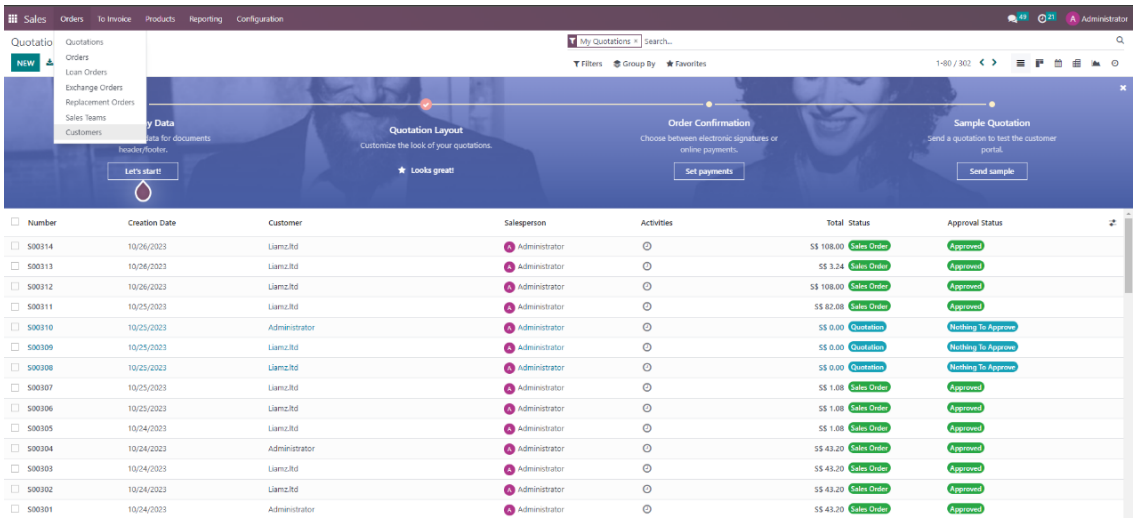


Here we can set the password and then we can try to log in with this user.

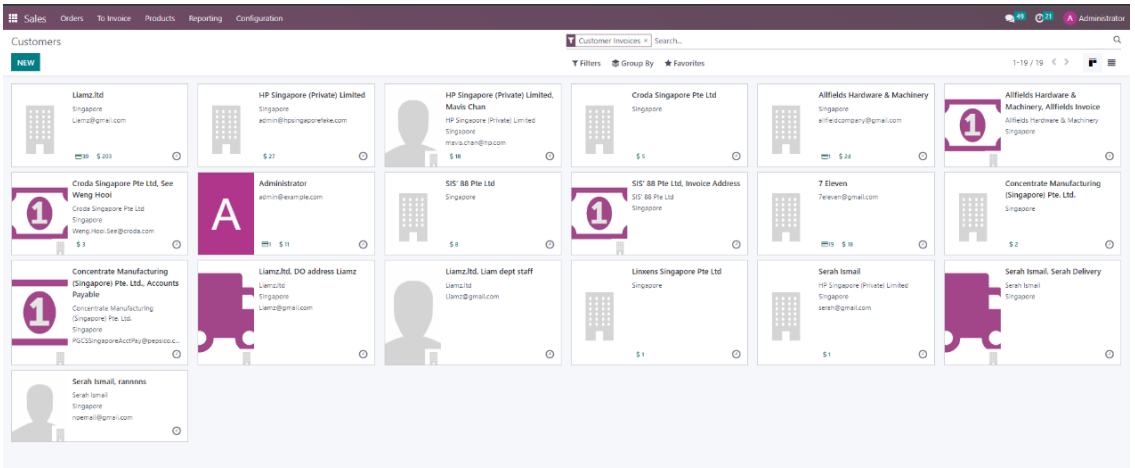
3. Contact & Vendor

3.1. Customer

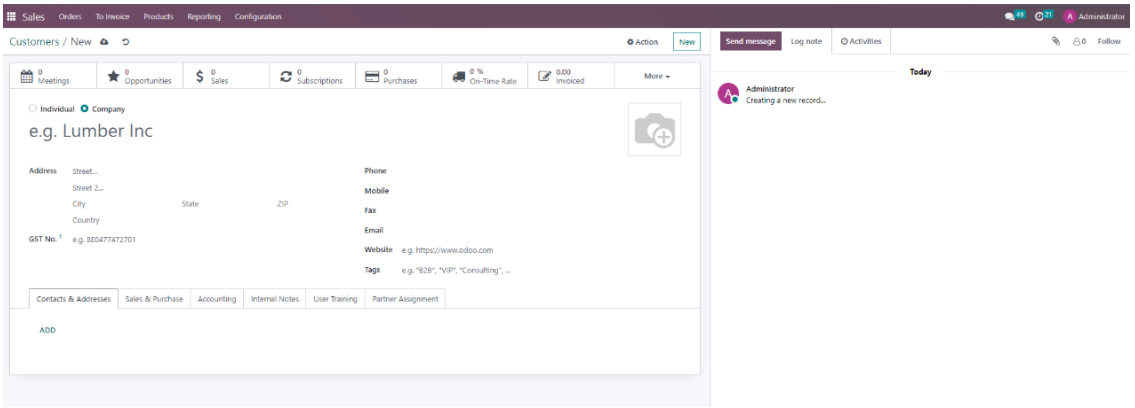
Go to the Main Dashboard, then can click on the "**Sales**" Module Icon



Then form here Click the Menu "**Orders**" and Click the Sub-Menu "**Customers**"



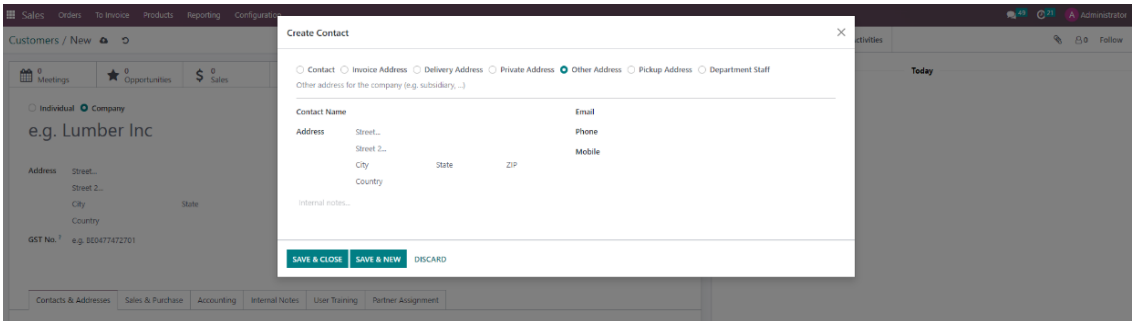
Then from here Click the "**Create**" Button on Top Left.



On the Customer Form, you can choose either Individual or Company for the Customer. Then you can add the Customer name and all of the Customer Data.

3.1.1 Customer Contact and Addresses

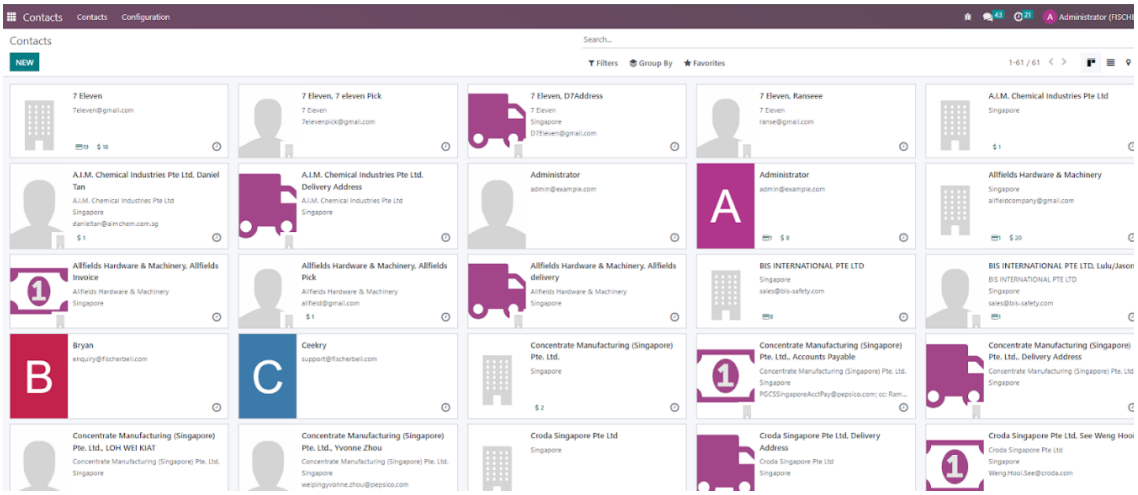
If Customers have multiple Contact or Addresses, then on the Tab “Contacts and addresses” you can click the Add button



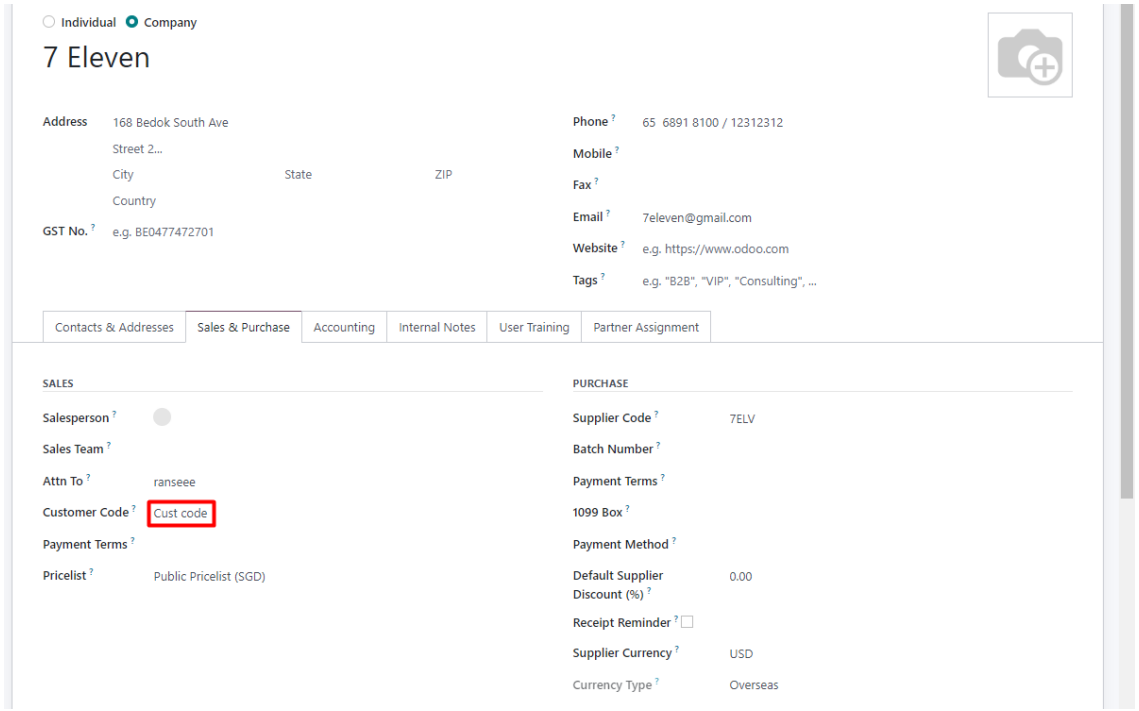
Upon Clicking the Add Button a pop-up will appear, here you can set the data of Contacts/Addresses for the Customer.

3.1.2. Assign Customer code

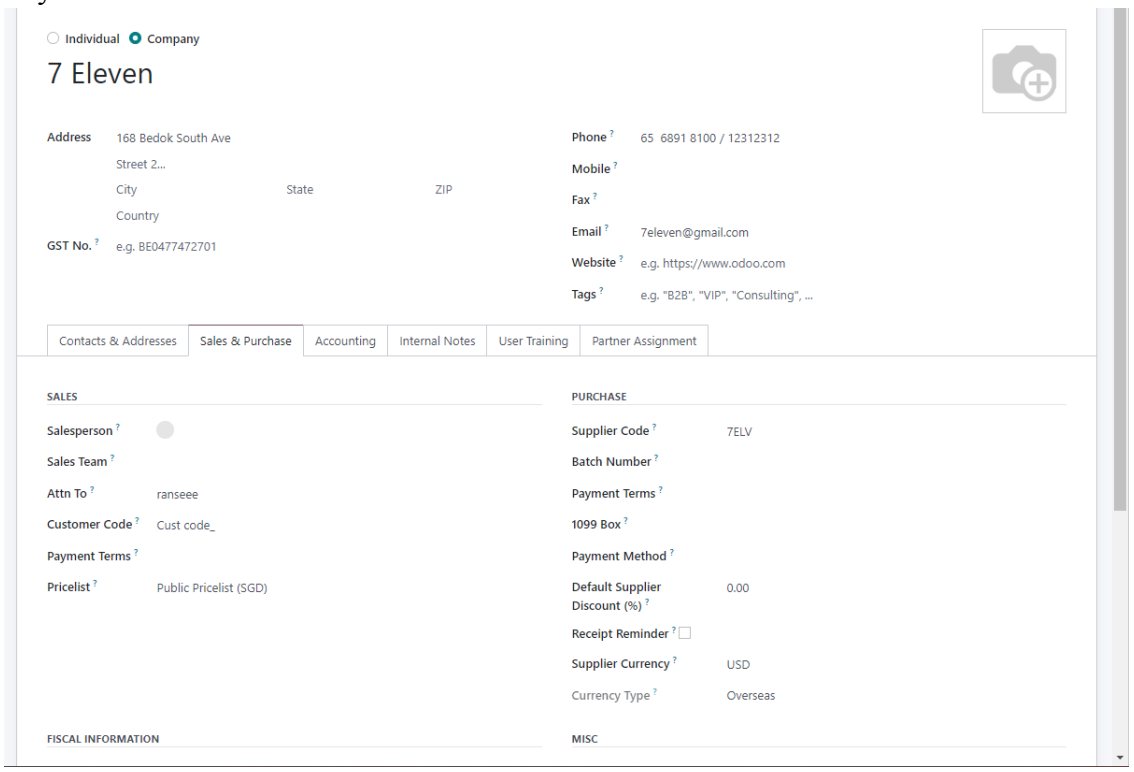
Go to contact and choose the contact that you assign a customer to



In the sales & purchase tab, you will find a customer code field that will act as our customer code

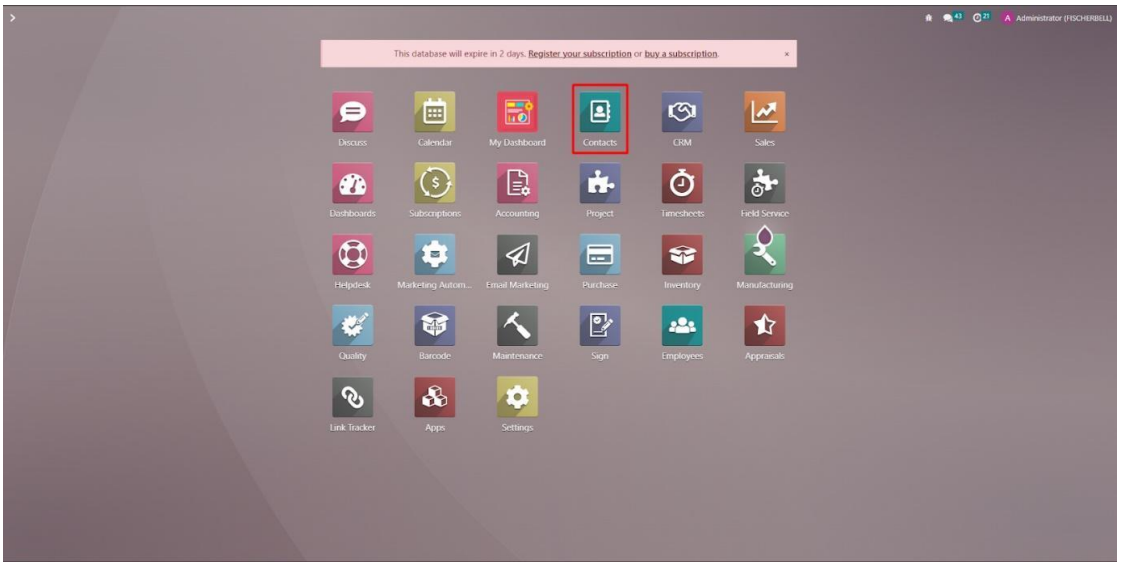


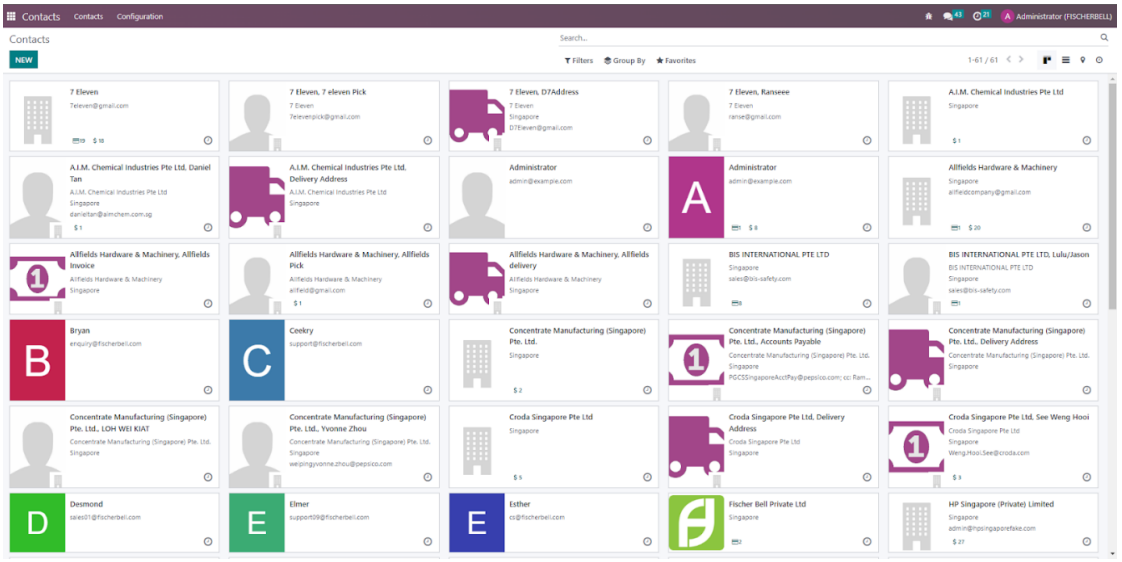
Key in the customer code and save



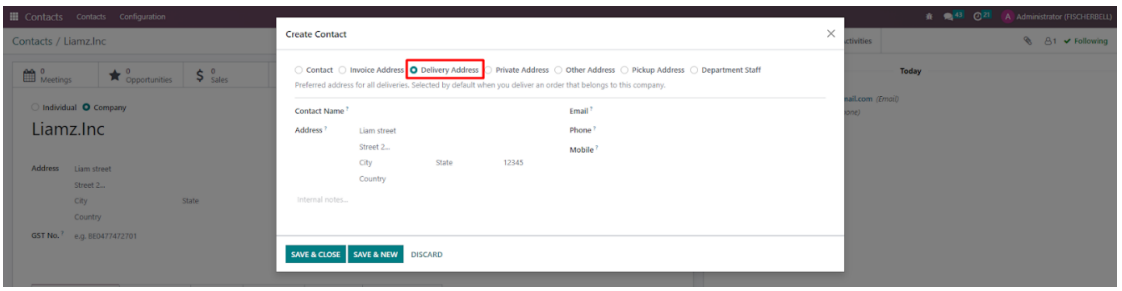
3.1.3. Assign attn. to, Bill to, Ship to

The first thing we need to do is to go to the contact module and pick a contact that you want to edit



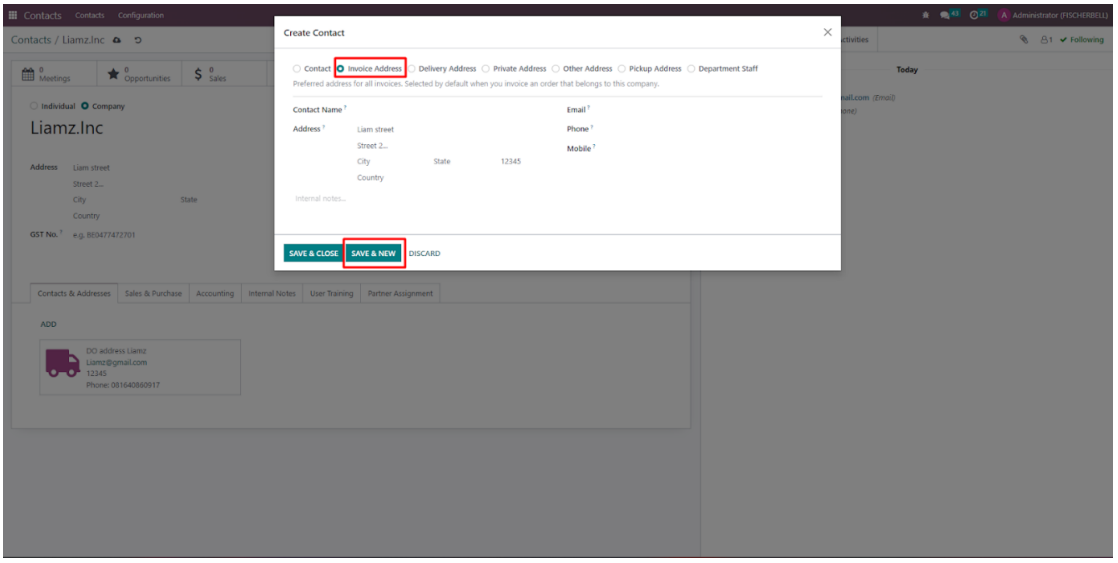


In the contact of your choosing click on add and choose the delivery address this delivery address will act as the ship to address

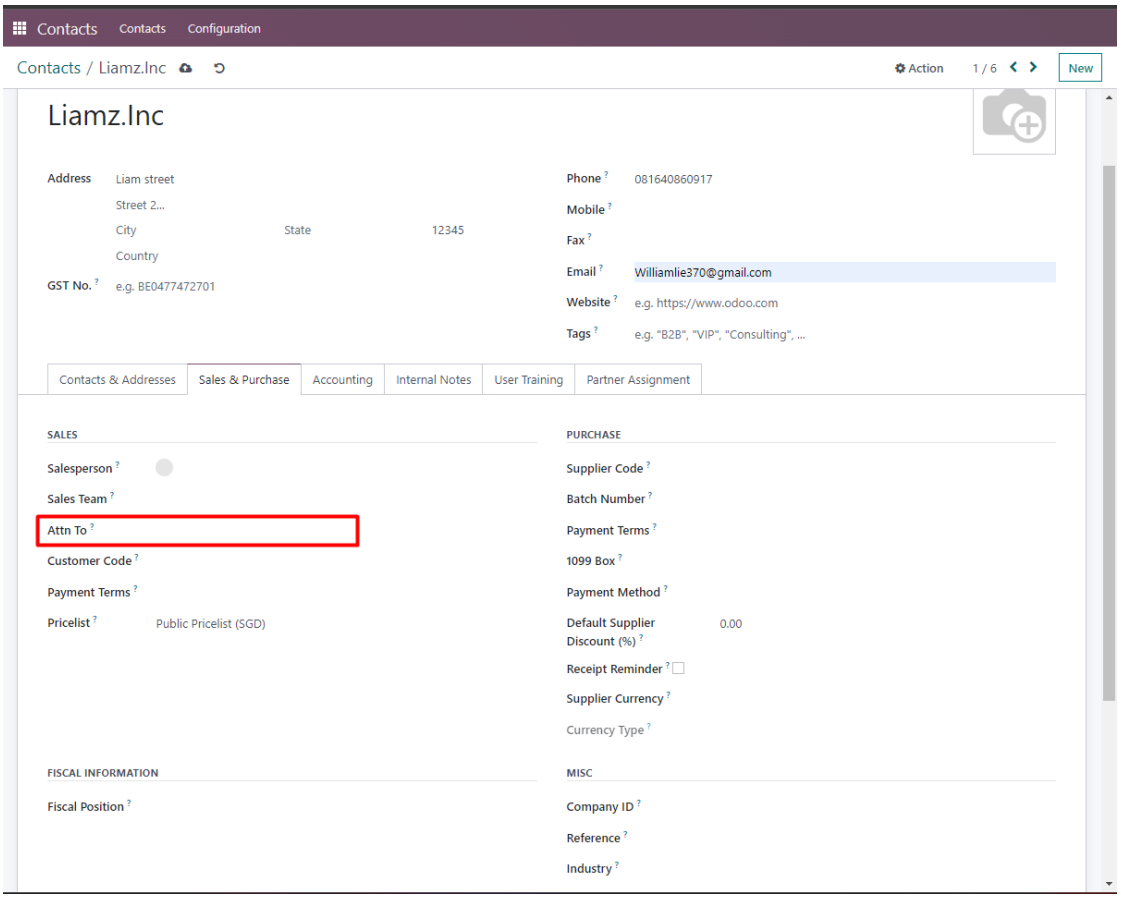


Click on the save & new if you want to create another address, if not then click on save & close.

Click and assign on the Invoice address as this will act as the bill to address

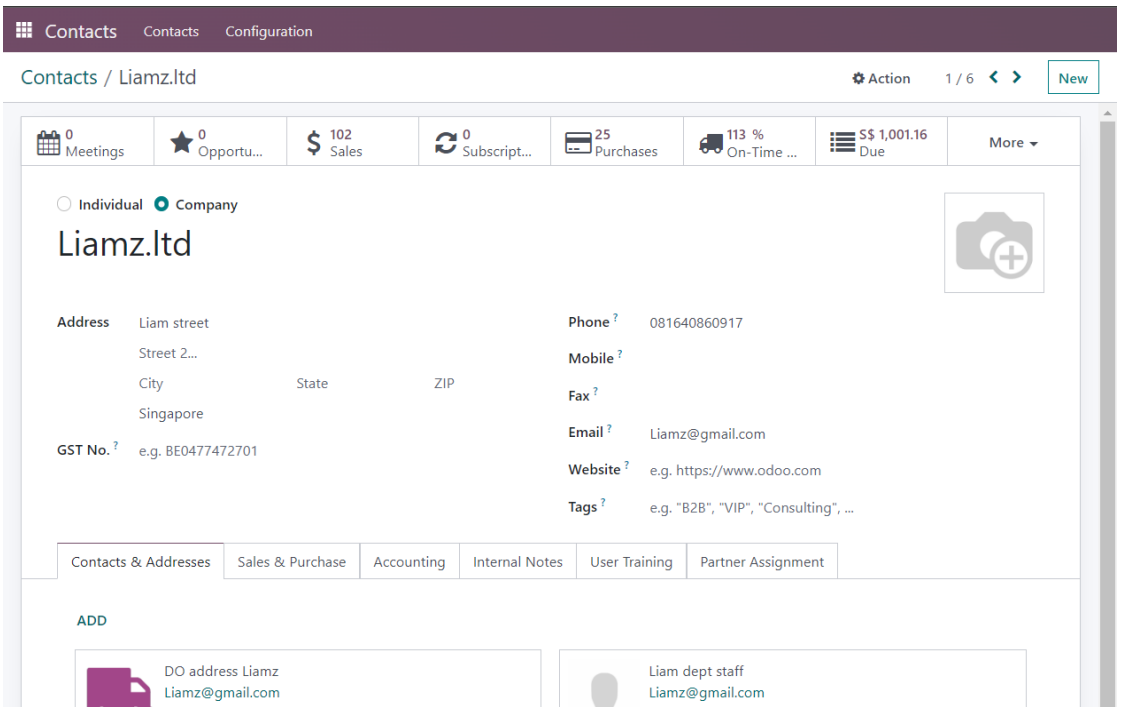


Head to the sales & purchase tab and assign the Attn to here

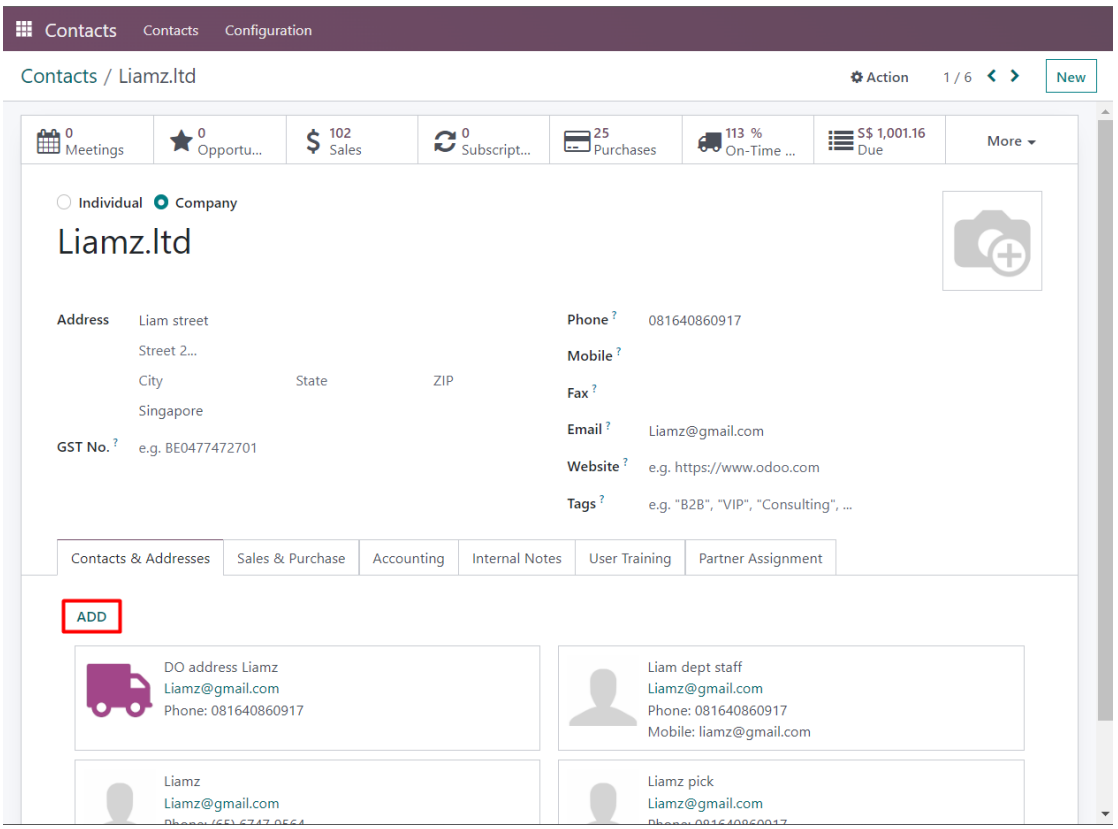


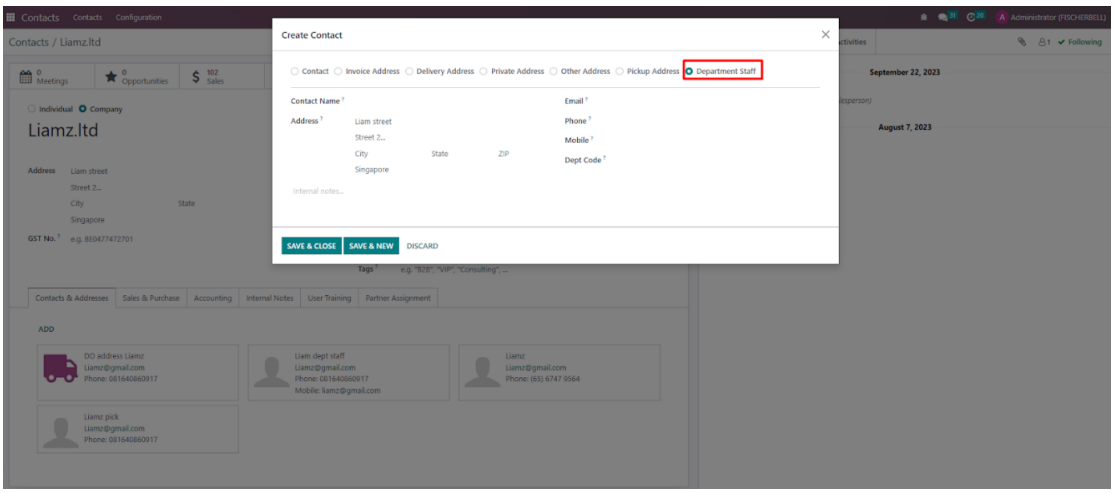
3.1.4 Assign dept staff information

Go to contact module > choose a company to assign dept staff

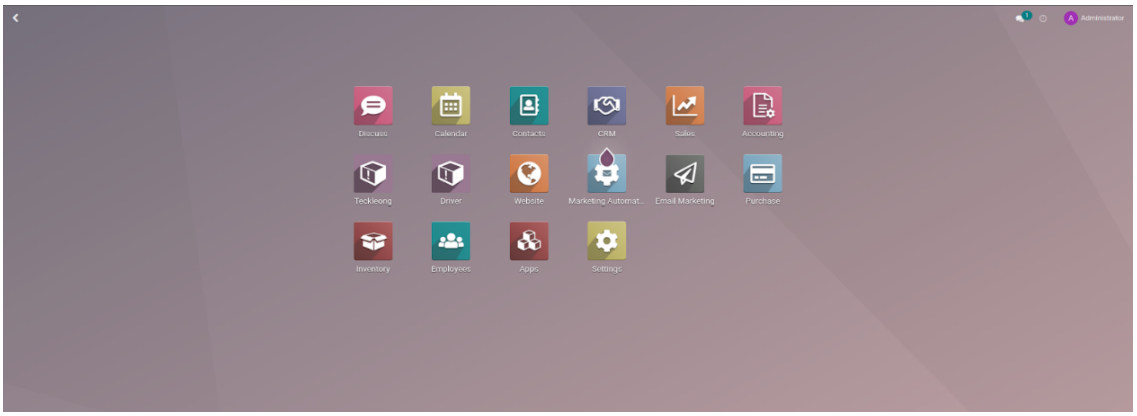


Add a dept staff contact and save it

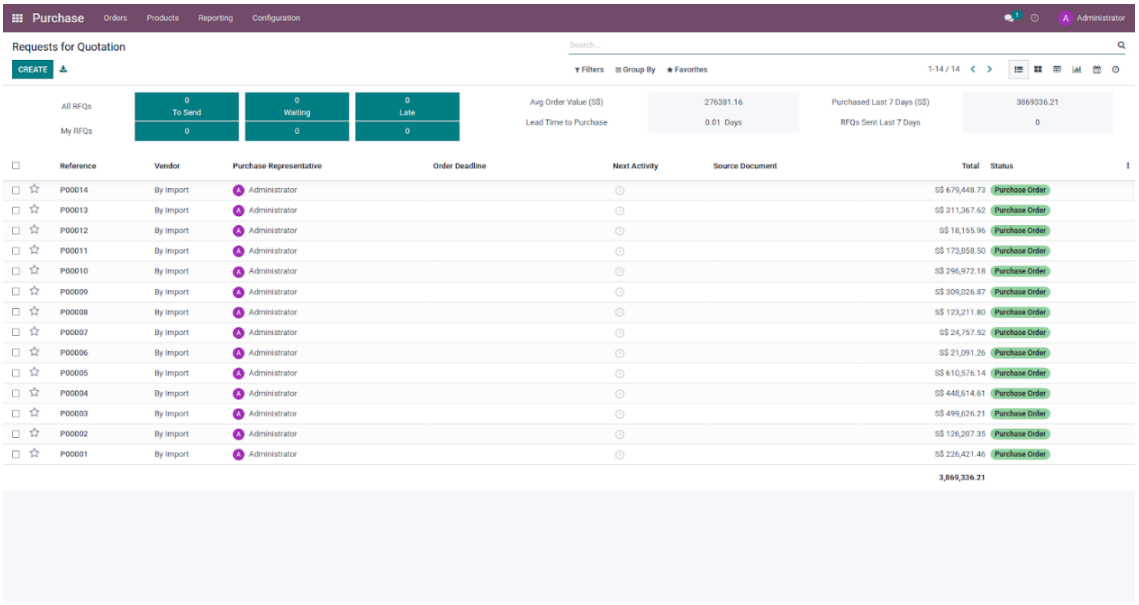




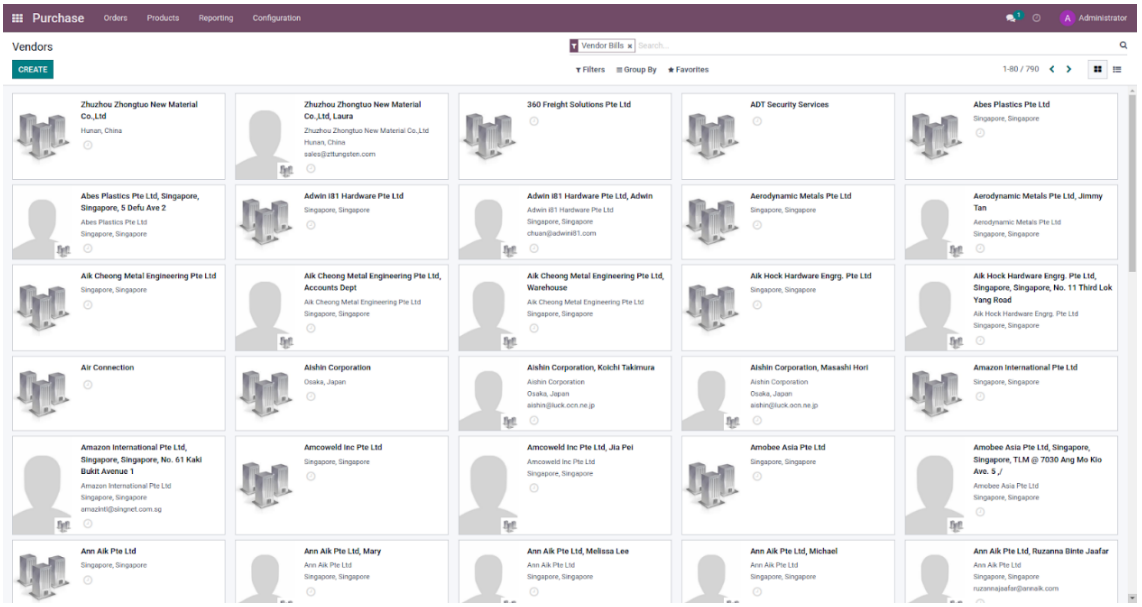
3.2. Vendor



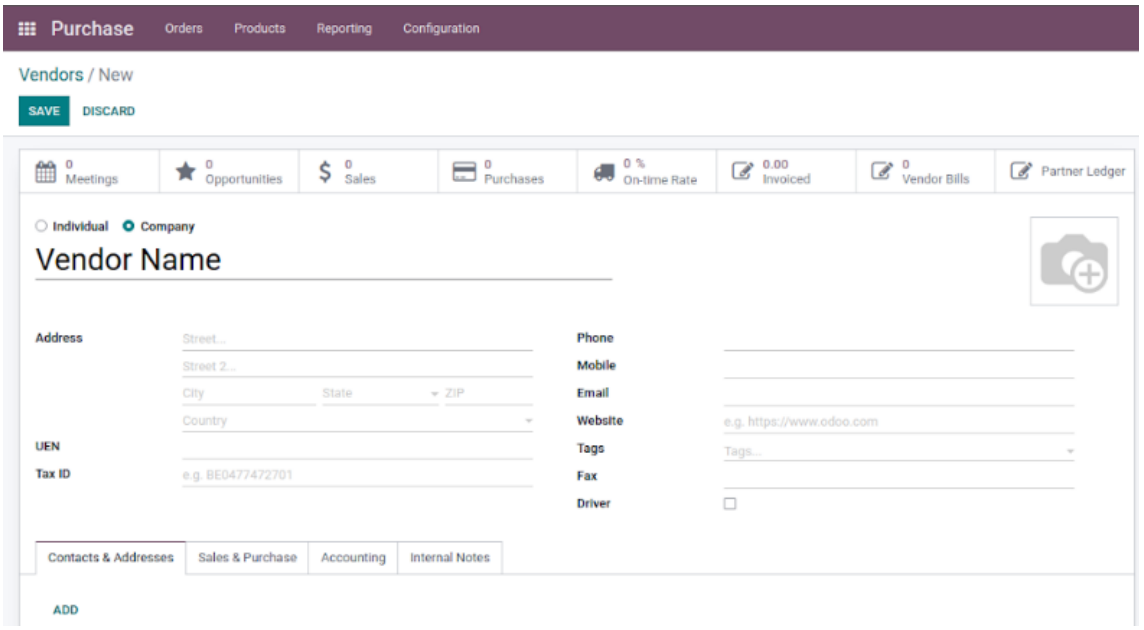
Go to the Main Dashboard, then can click on the "**Purchase**" Module Icon



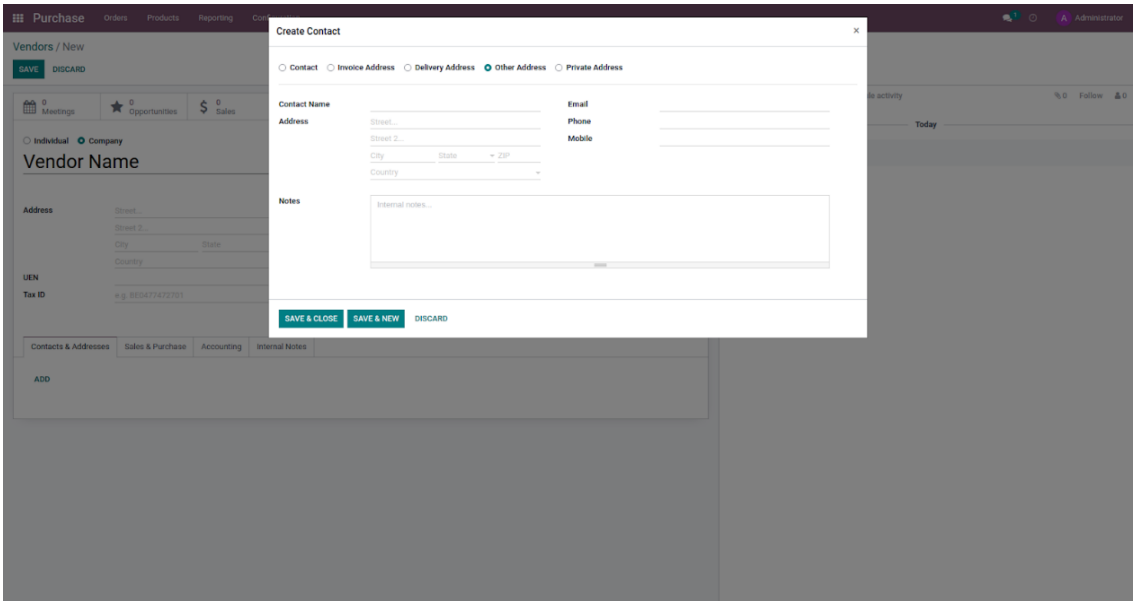
Then form here Click the Menu “**Orders**” and Click the Sub-Menu “**Vendors**”



Then from here Click the “Create” Button on Top Left.



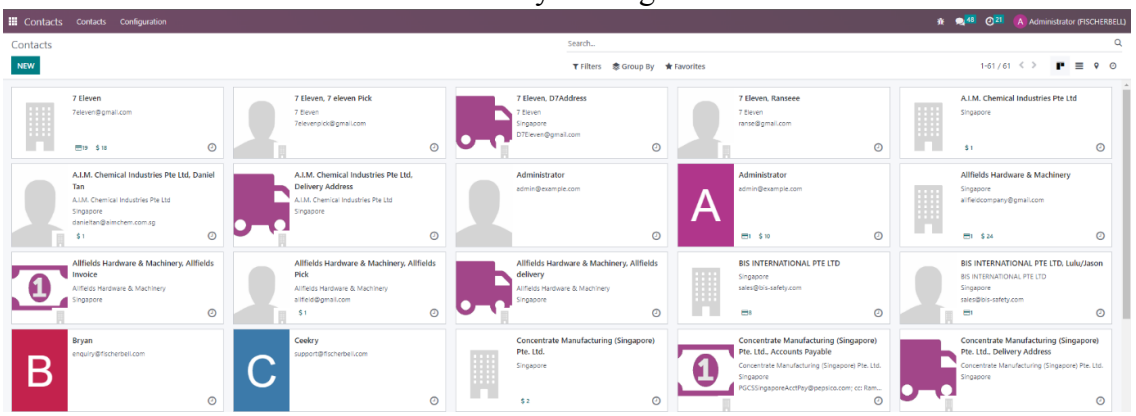
On the Vendor Form, you can choose either Individual or Company for the Vendor. Then you can add the Vendor name and all of the Vendor Data. If Customers have multiple Contact or Addresses then on the Tab “Contacts and addresses” you can click the Add button



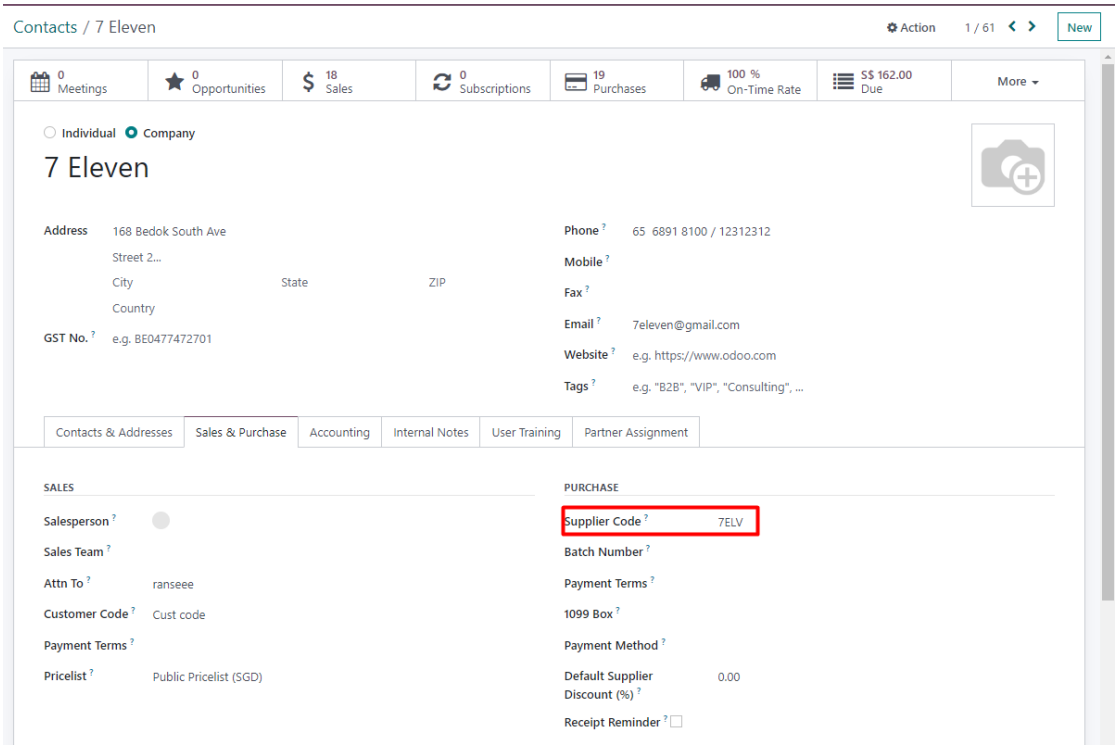
Upon Clicking the Add Button a pop-up will appear, here you can set the data of Contacts/Addresses for the Vendor.

3.2.1. Assign Vendor Code

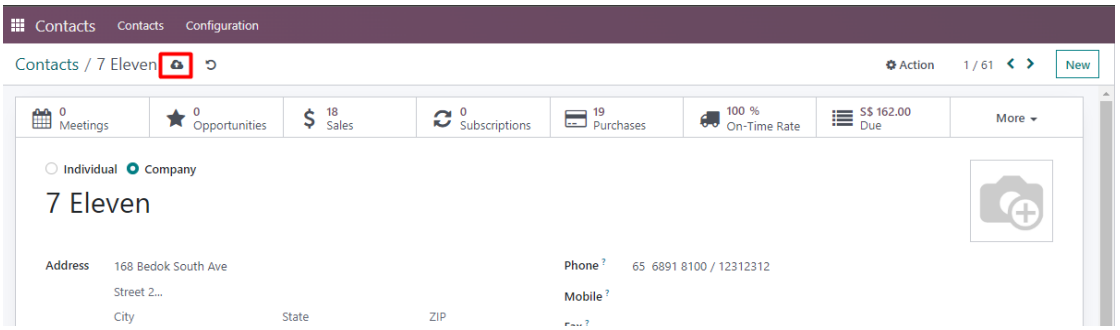
Go to contact and choose the contact that you assign a vendor code to



In the sales & purchase tab, you will find a supplier code field that will act as our vendor code

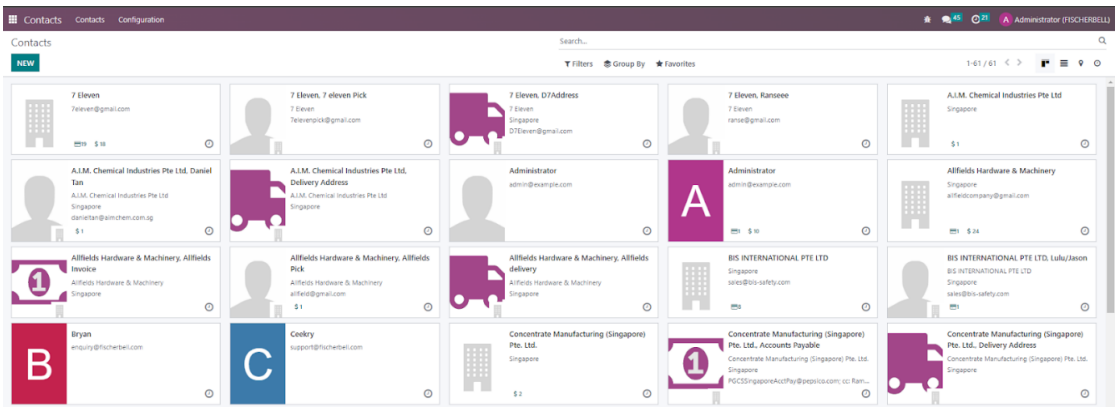


Key in the supplier code and save

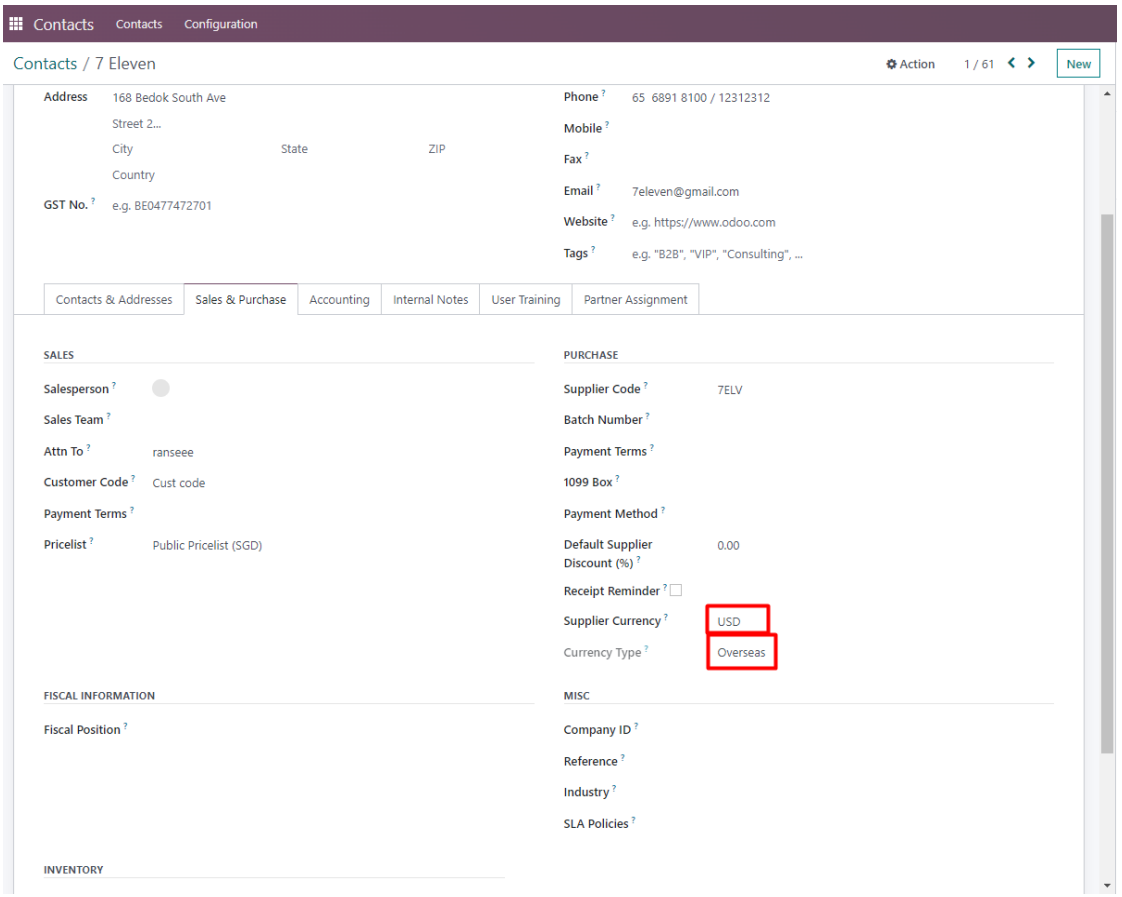


3.3. Local and overseas customer/supplier

Go to contacts > and choose the contact you want to view



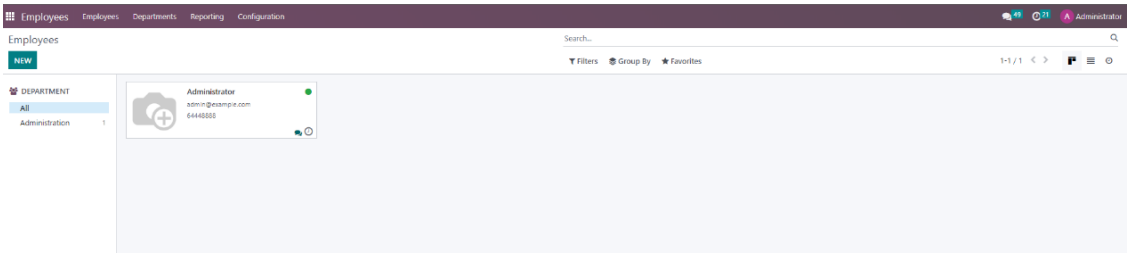
In the sales & purchase tab the system will be able to determine the type of customer from their currency



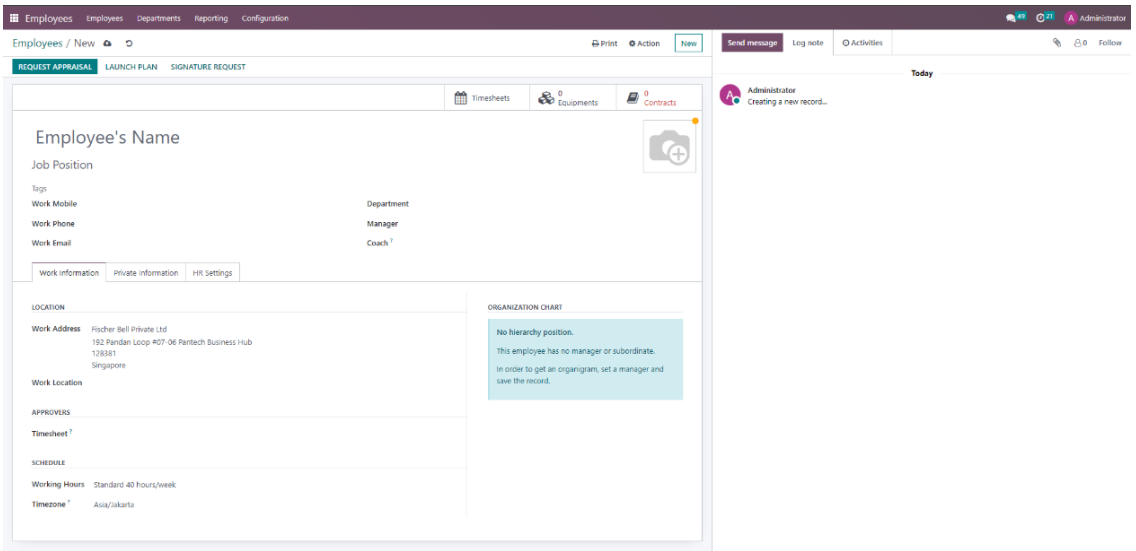
4. Employee

4.1. Employee

Go to the Main Dashboard, then click on the "**Employee**" Module Icon.



Then from here Click the "**Create**" Button on Top Left

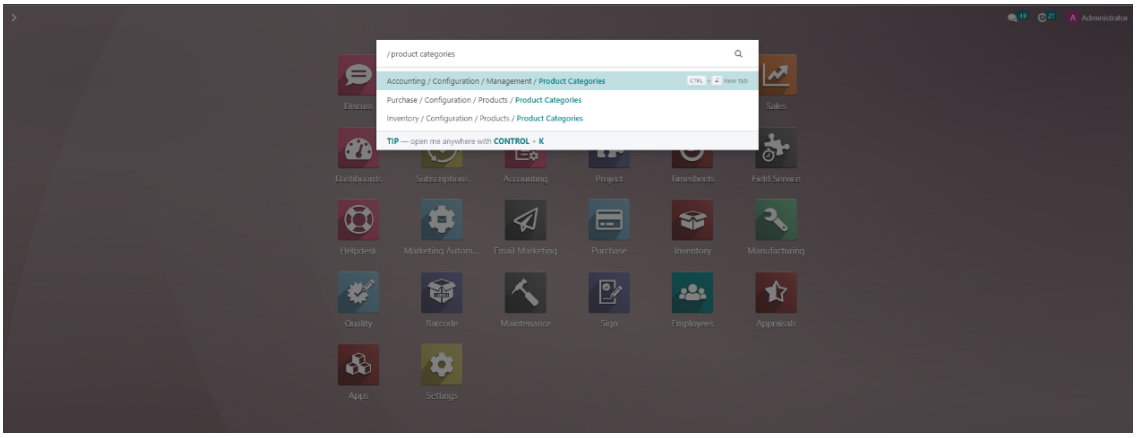


Here you can set the data of the Employee like the name and others.

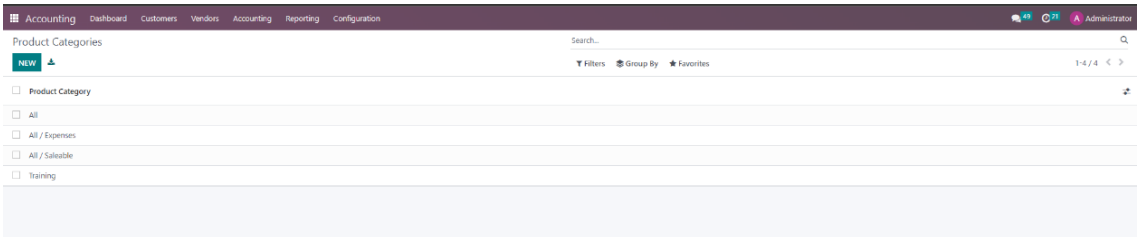
5. Inventory

5.1. Product Categories

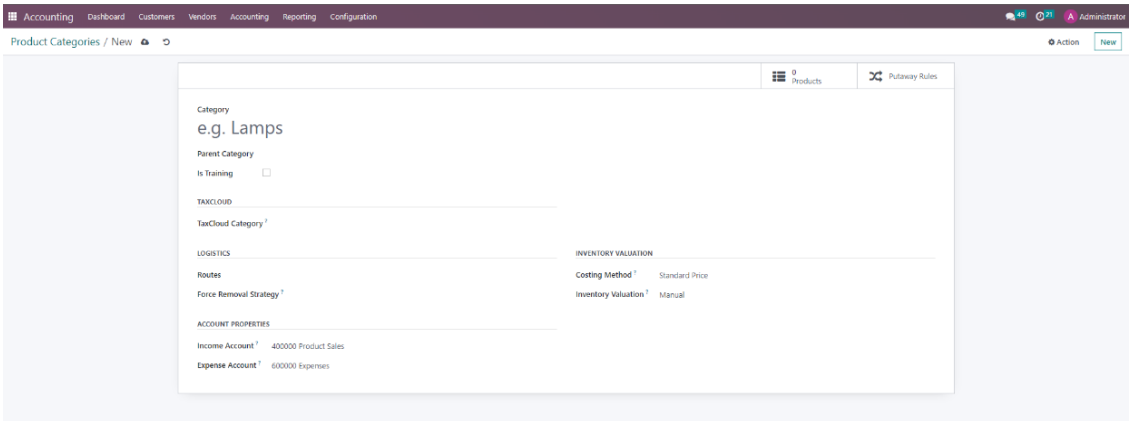
First go to the Main Dashboard.



Then type "**Product Categories**" then the system will show you a list, you select one of the three above.



After that we want to click the "**Create**" button on the top left

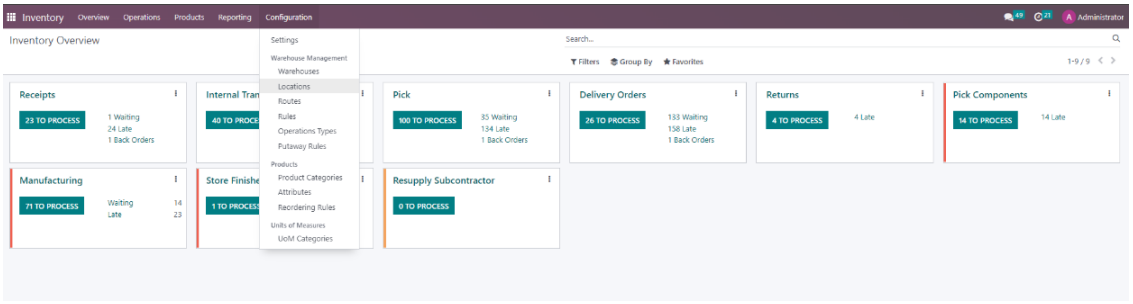


On the Product Categories Form you just need to insert the Product Categories Name.

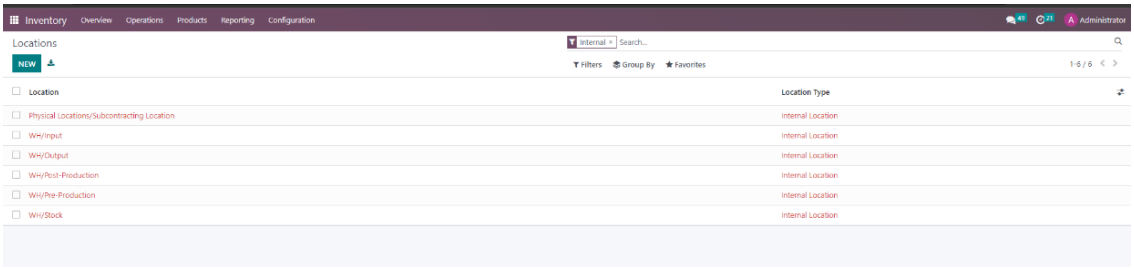
Note: The other input will be set as default so no need to change it

5.2. Location

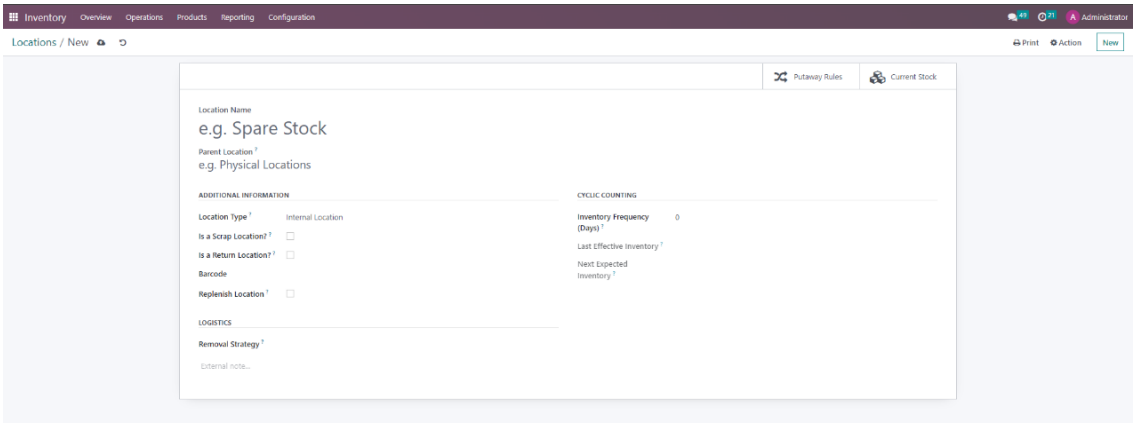
Go to the Main Dashboard, then click on the “Inventory” Module Icon.



Then from here Click the Menu “**Configuration**” and Click the Sub-Menu “**Locations**



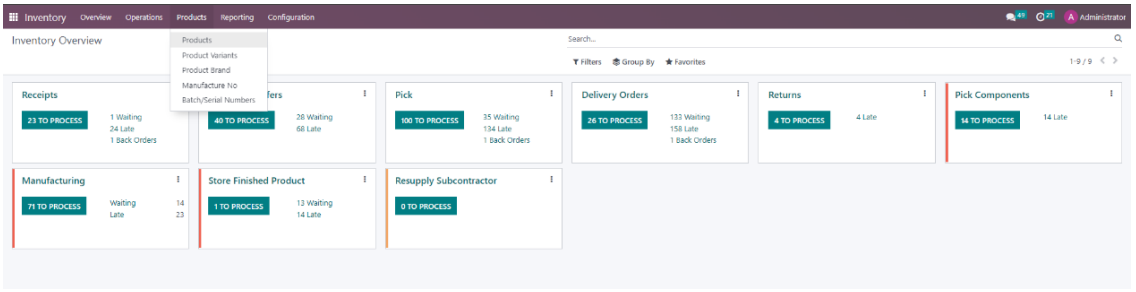
Then from here Click the “**Create**” Button on Top Left



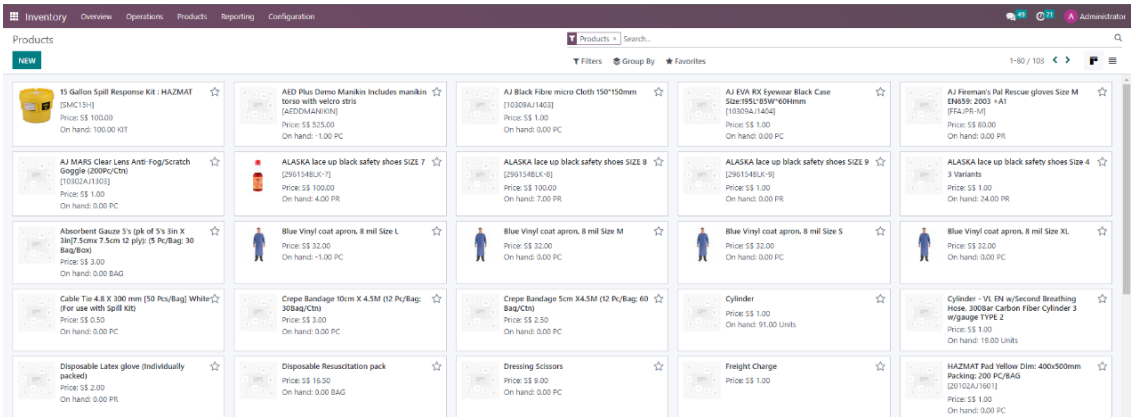
On the Location Form, you can set the Location Name and then set the Parent Location.

5.3. Product

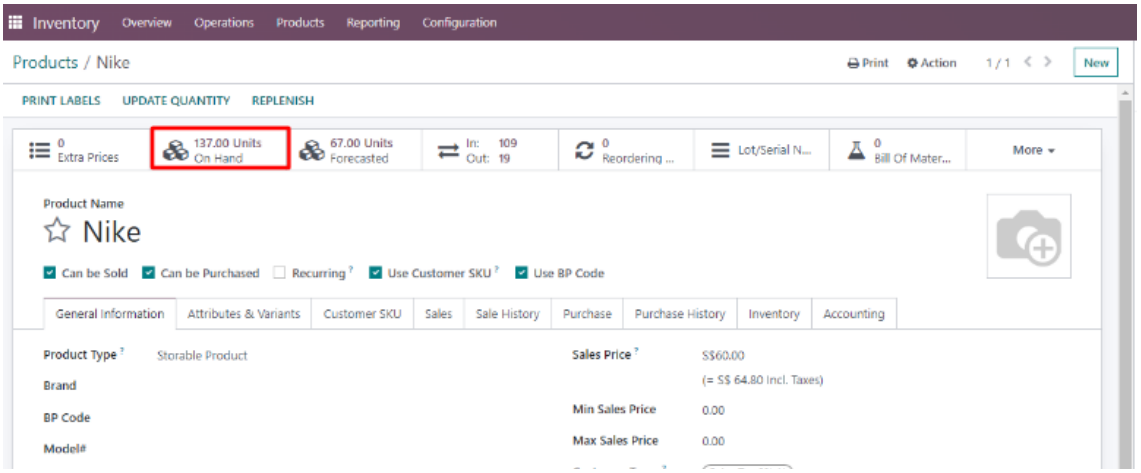
Go to the Main Dashboard, then can click on the “**Inventory**” Module Icon



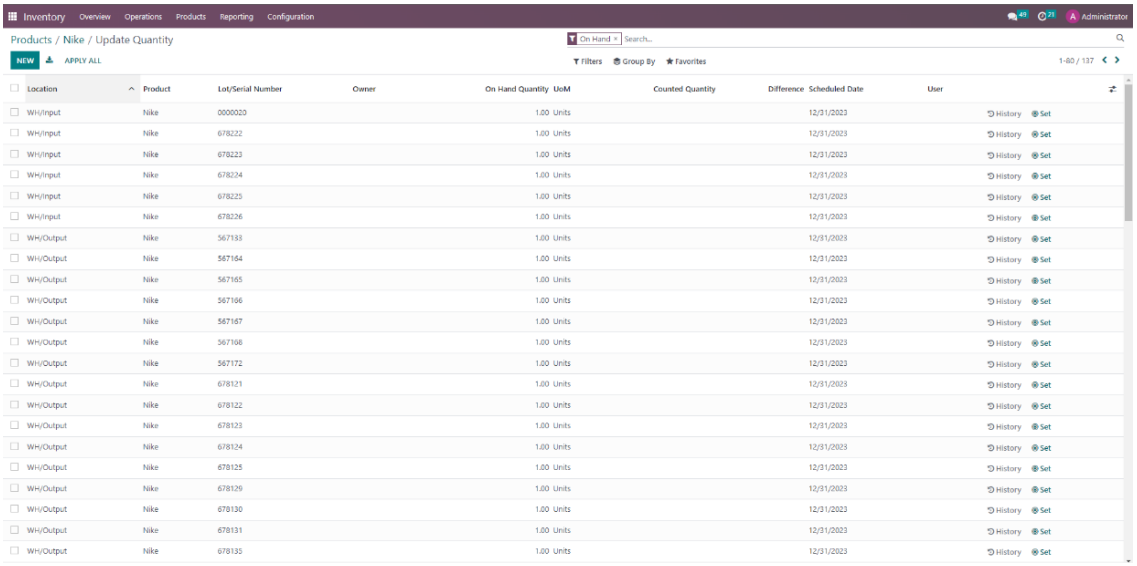
After that, click the menu **Products** then select the sub-menu **Products**



5.4. Stocks

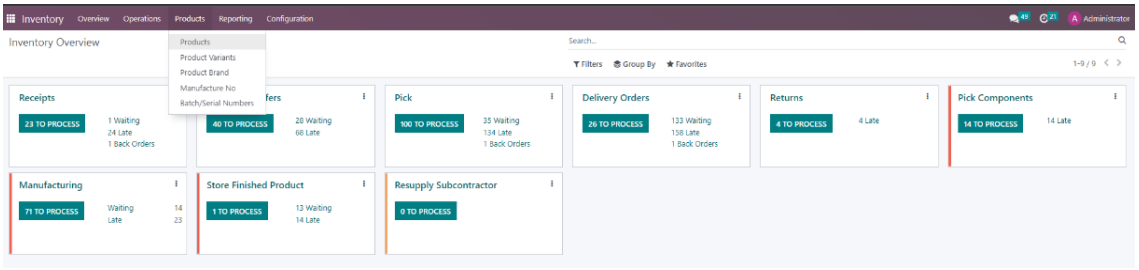


To check Products Stock, from the Product Form you can click the On Hand Smart Button.



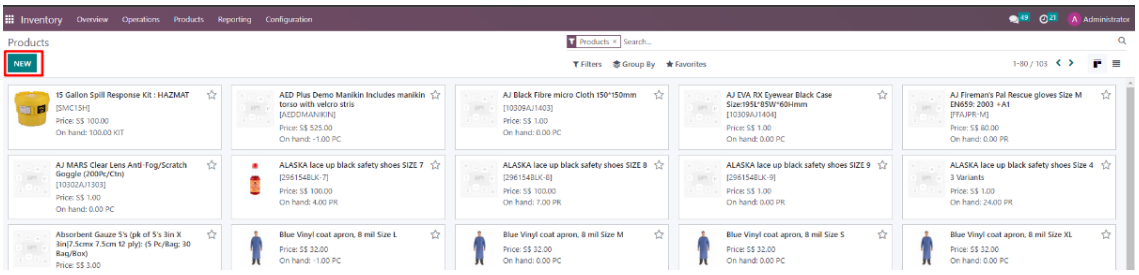
On Click you can see all the lines of Stock the Product currently have and the location and lot name

5.5. Create Product

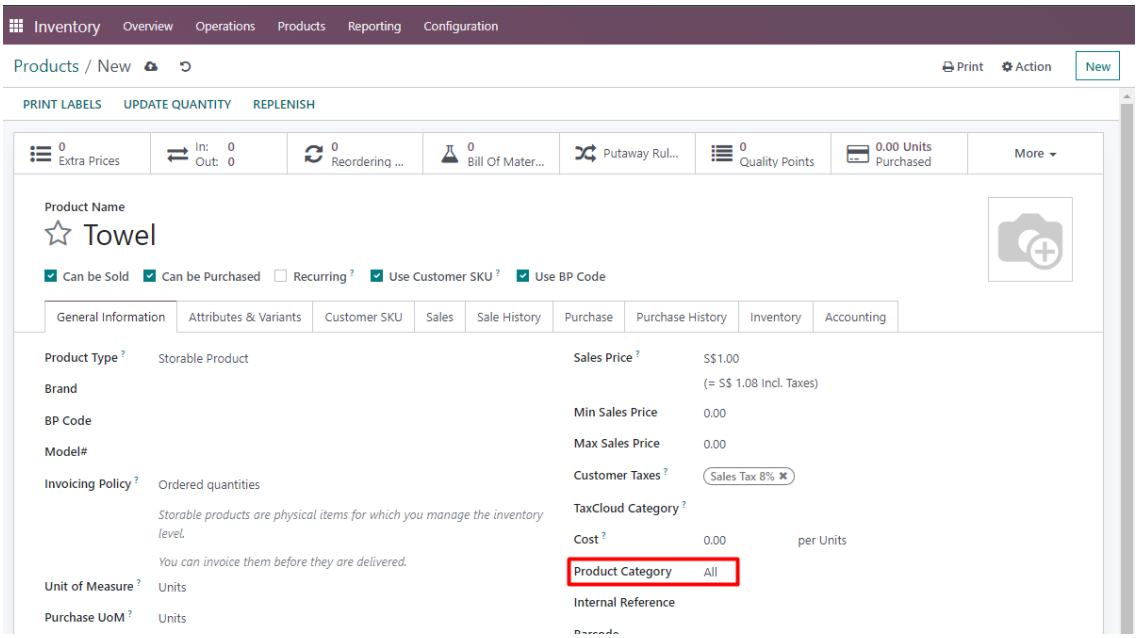


You can create a product by Going to the inventory module > products > products.

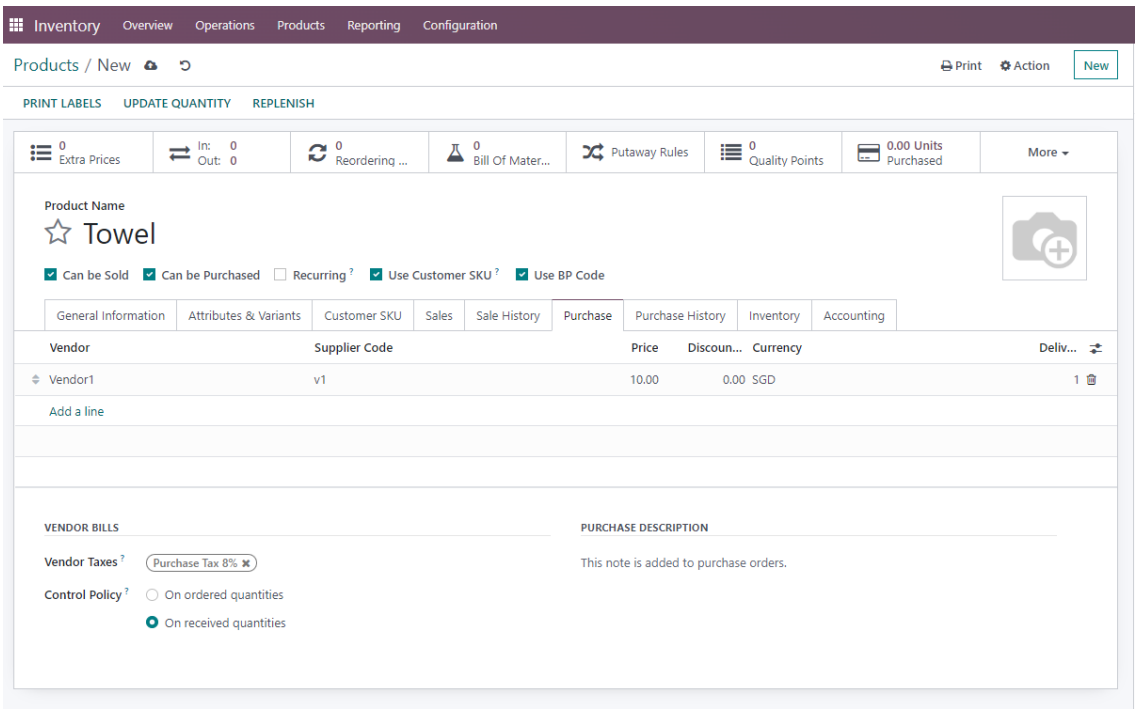
Then click the Create button.



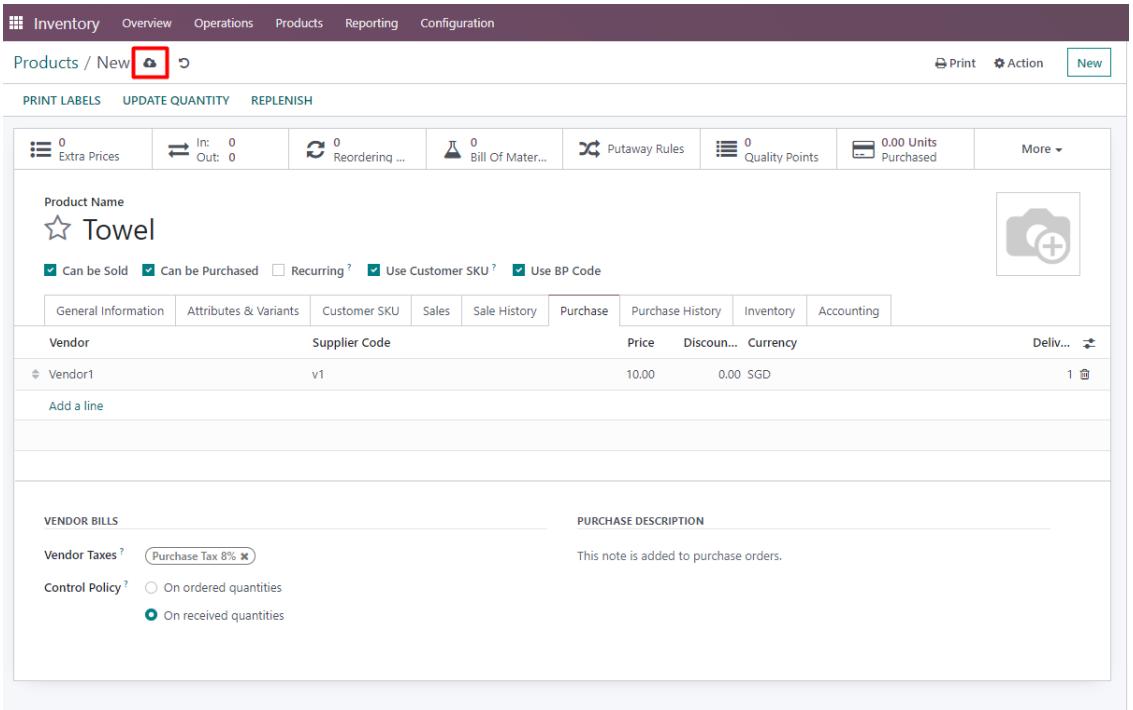
Key in the information, Key in the product category is a must



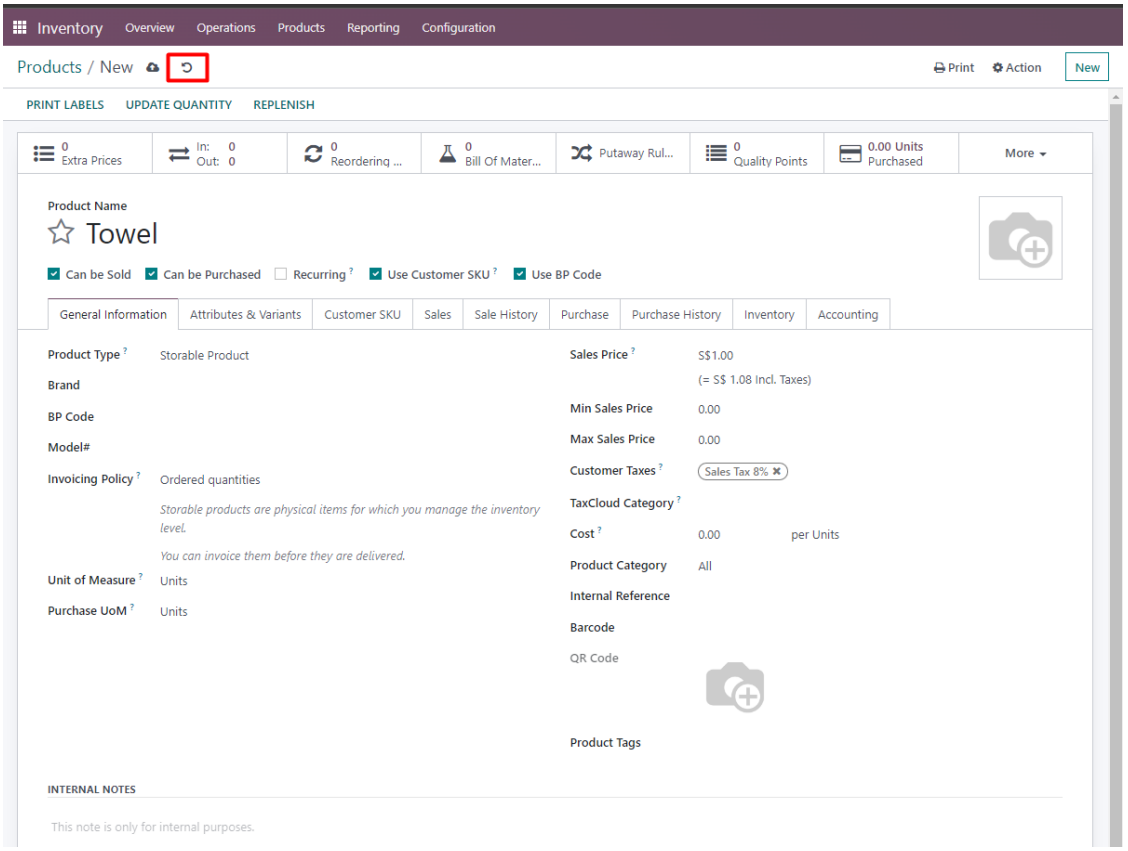
Go to the purchase tab to key in the vendor, price, and currency.



If you want to save, click the icon or go back to the product, and the system will automatically save the changes.

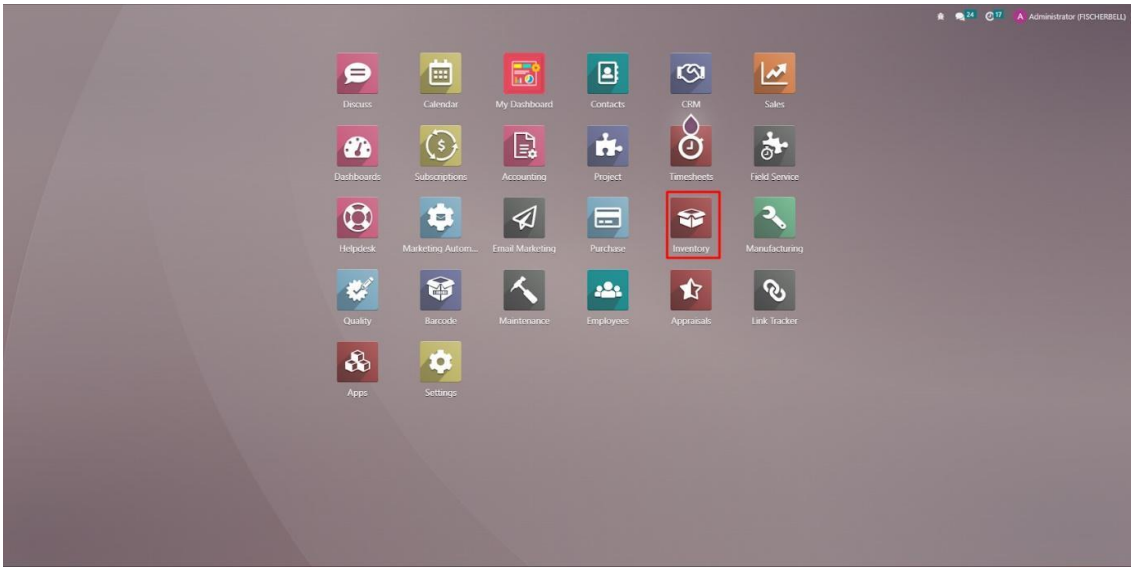


In case you want to cancel creation, click this icon.

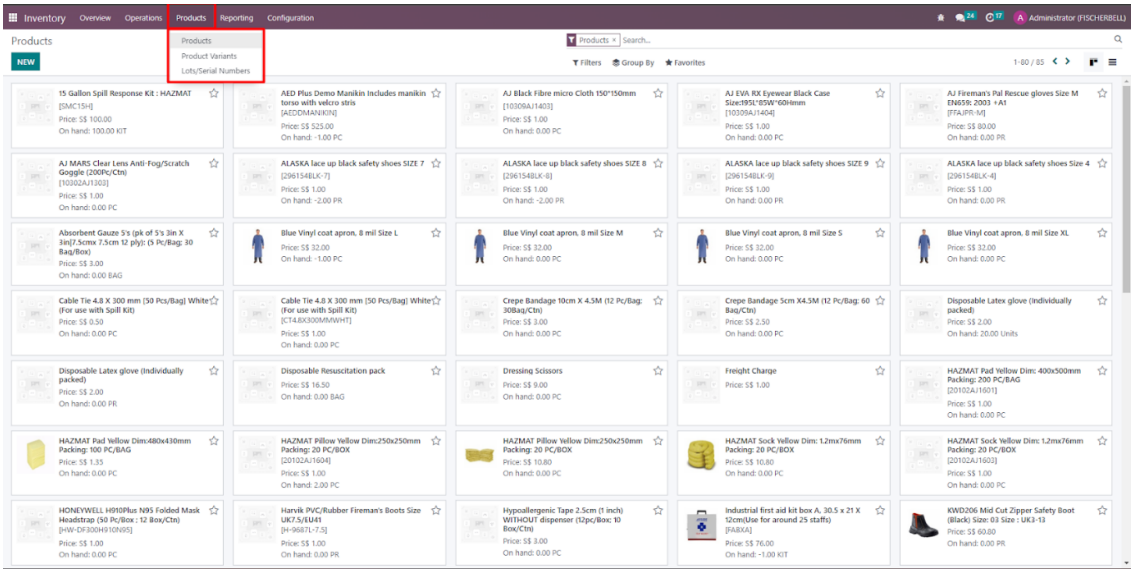


5.6. Products & Variants

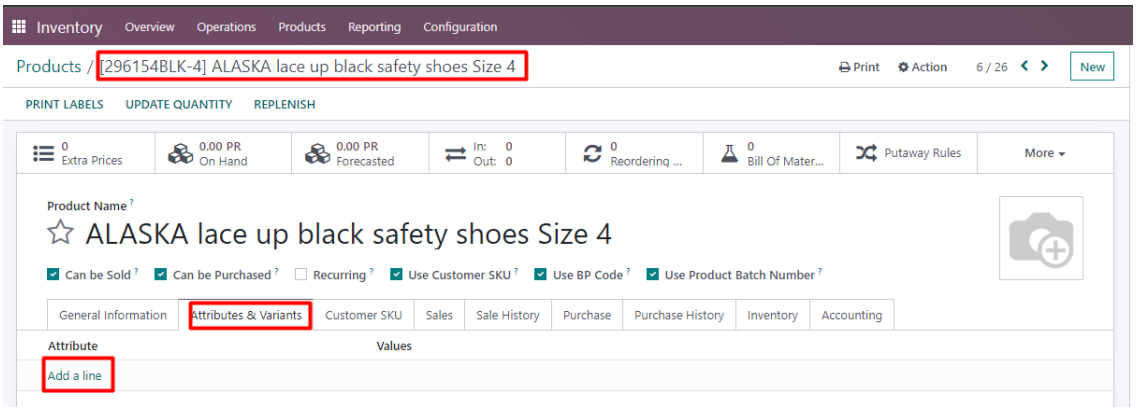
1. Go to inventory modules



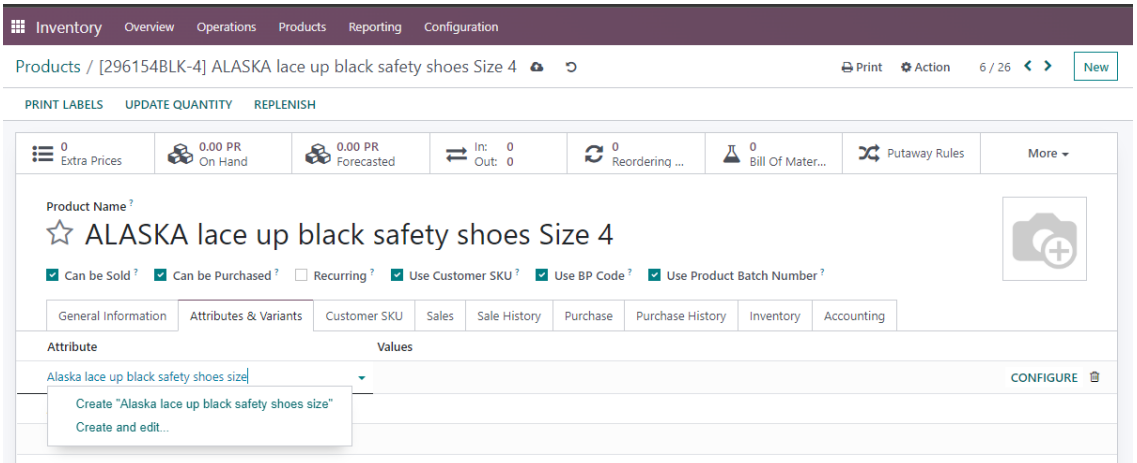
2. Go to products > products



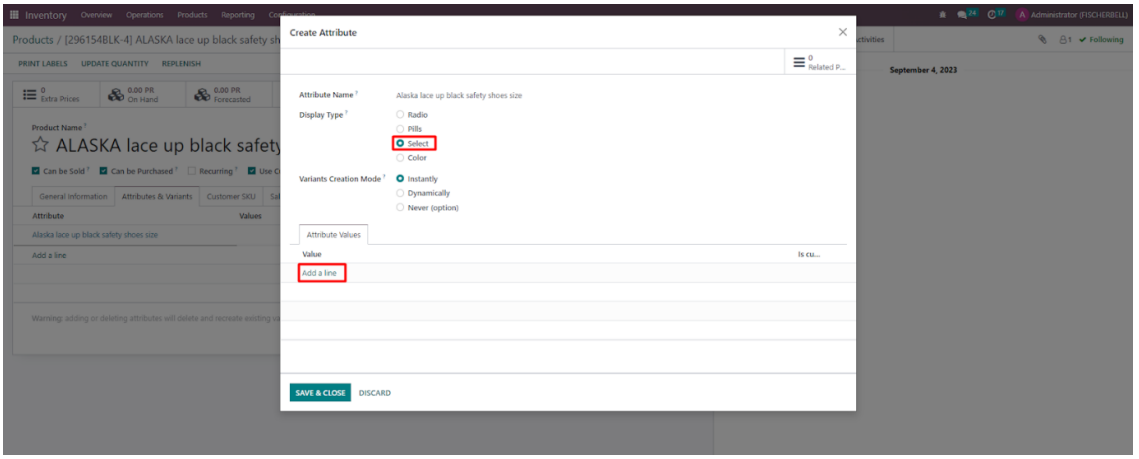
3. Click on a product you want to edit > attributes & variants tab > add a line



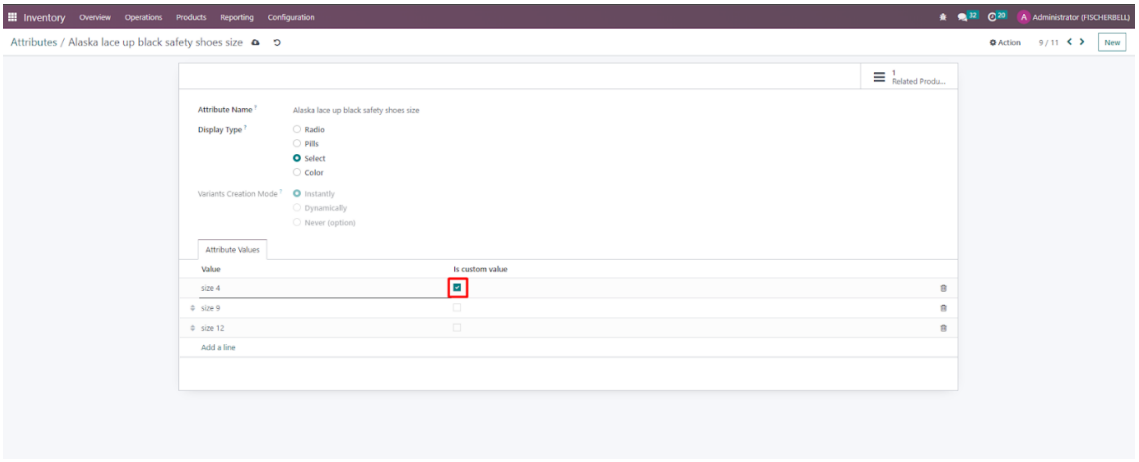
4. Add a line > key in attributes & variants name > create and edit



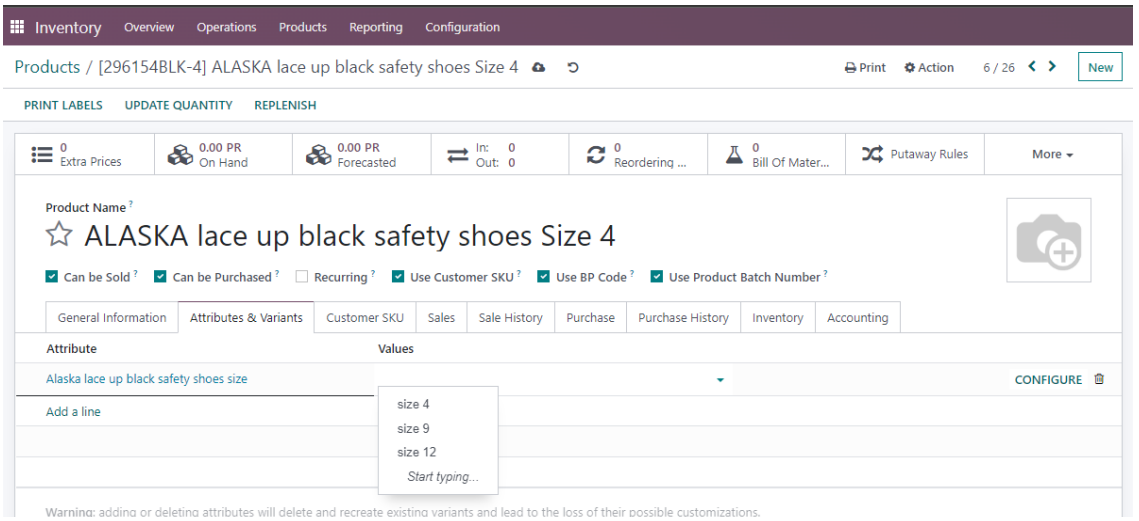
5. Choose the select option > add a value > save & close



6. Check on the “is custom value” box this will allow it to appear in the SO line

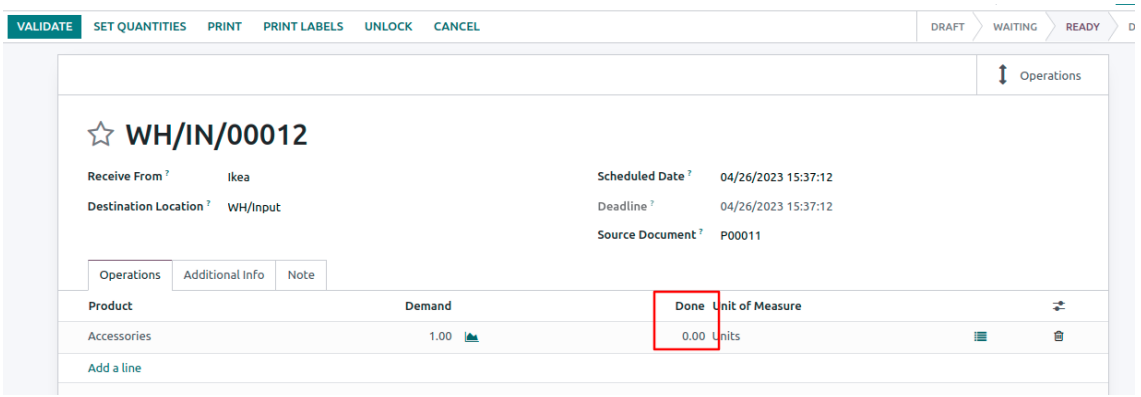


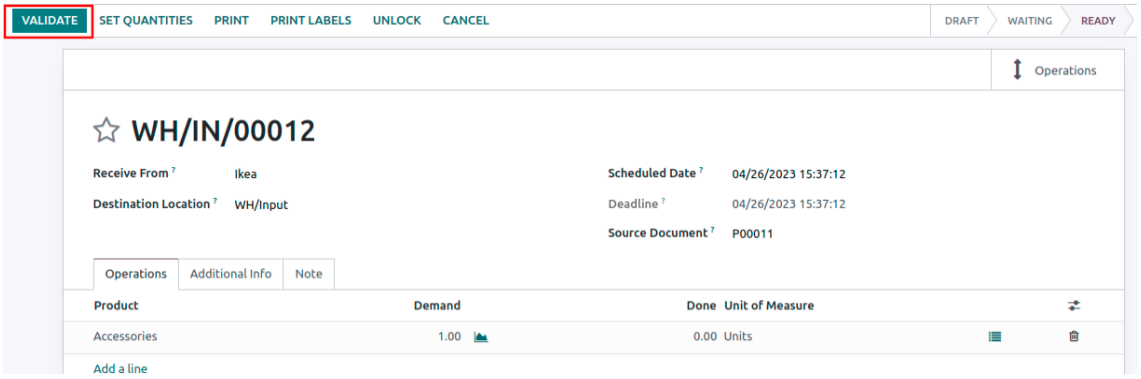
7. Add in the new value



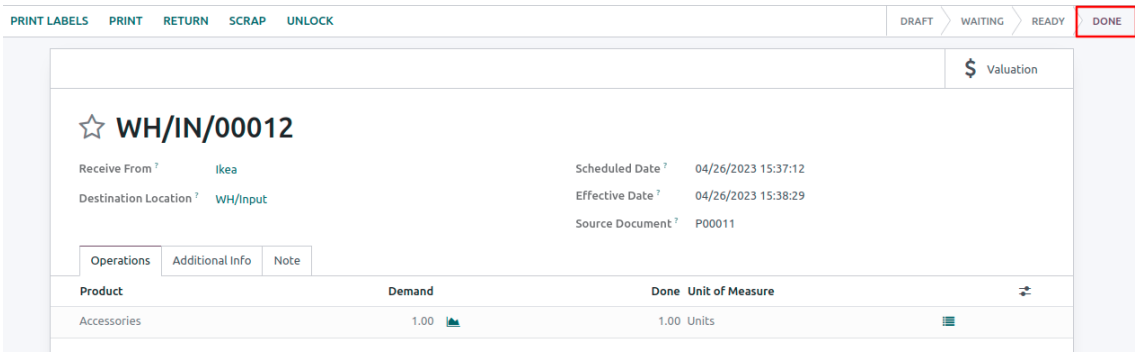
5.7. Receiving Goods

In Receipt form you can set the quantity done then click button validate.

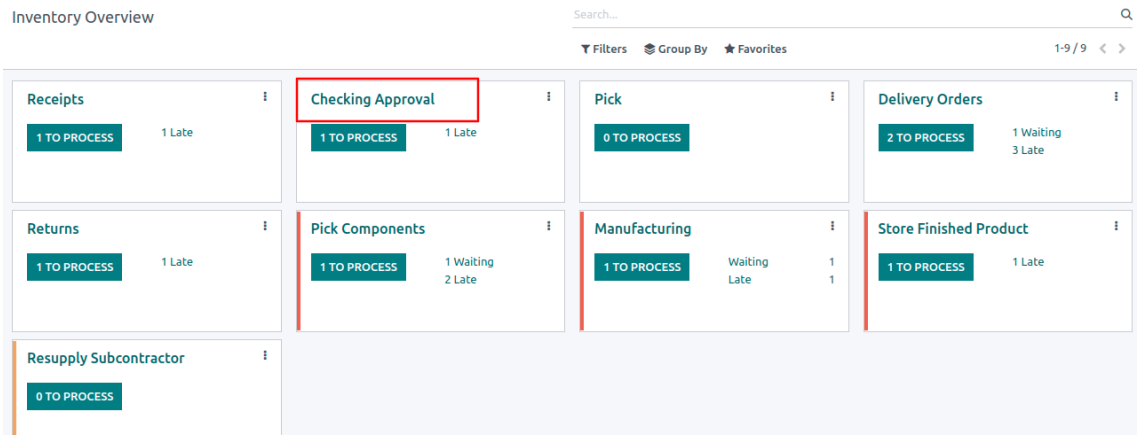




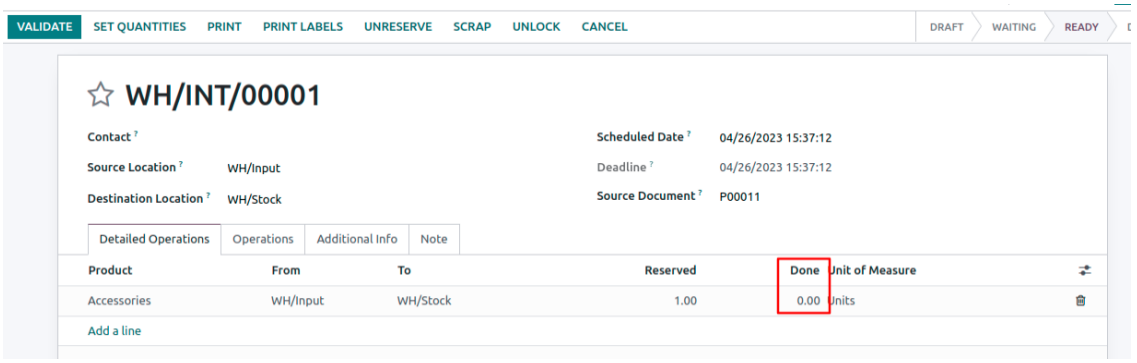
System will change the state from ready to become done.

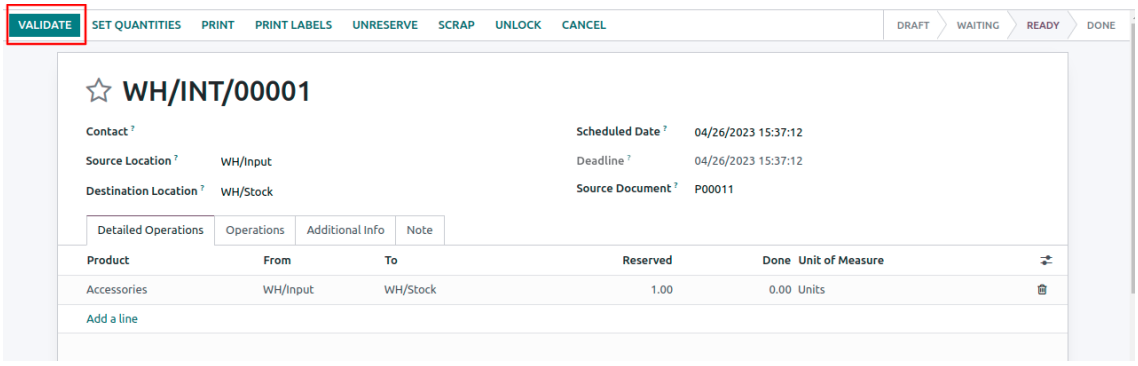


Go to inventory modules. In inventory overview, click checking approval. Then search the transfer.

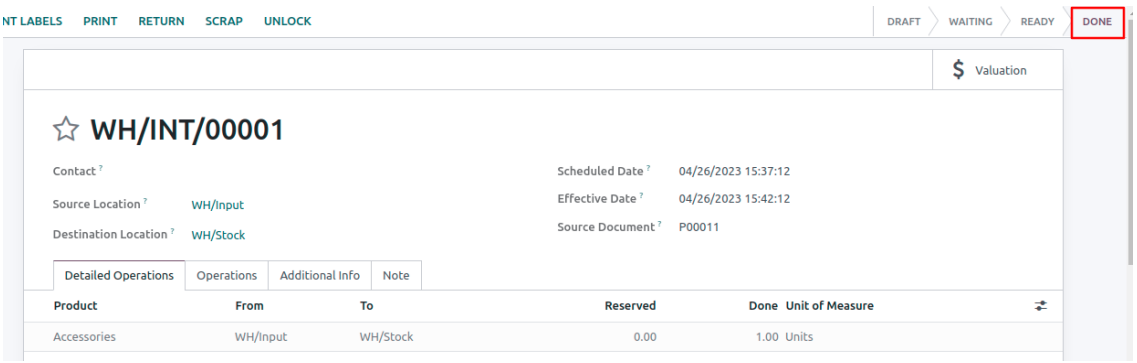


You can set the quantity done and validate the transfer by clicking the validate button.

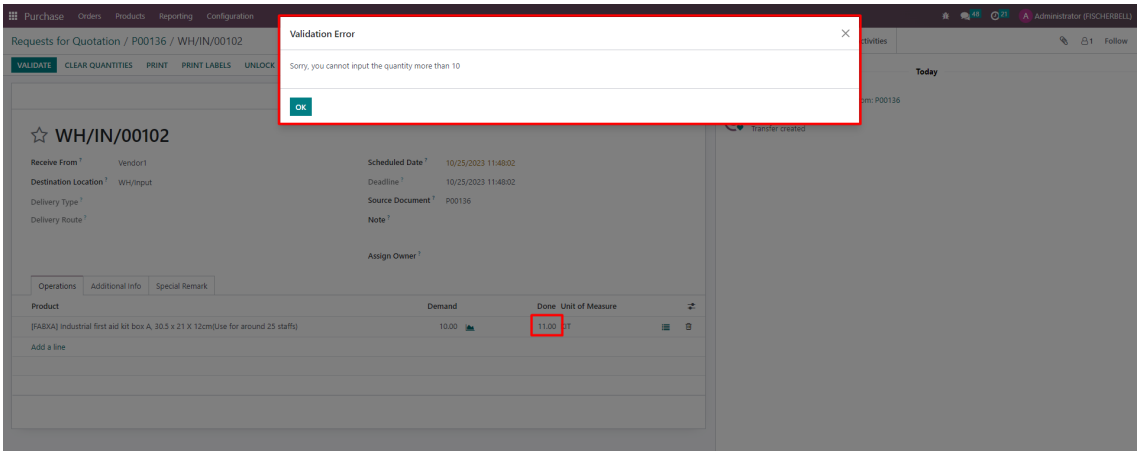




System will automatically change the state from ready to become done.

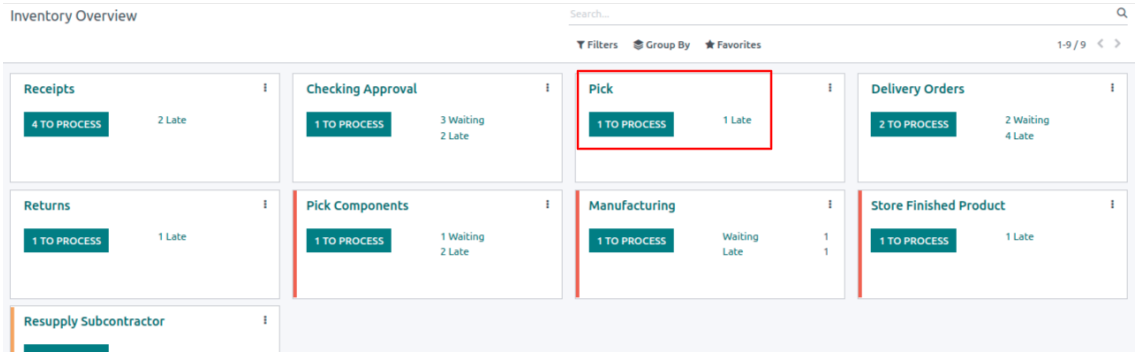


5.7.1. A error popup if user key in more quantity then the ordered quantity

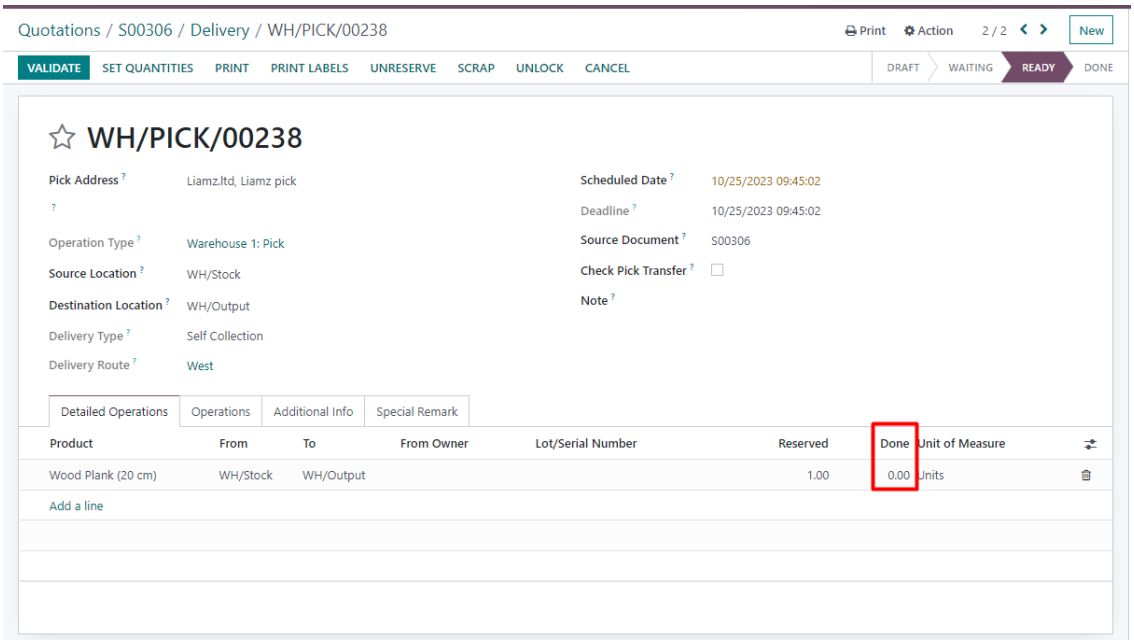


5.8. Delivery order

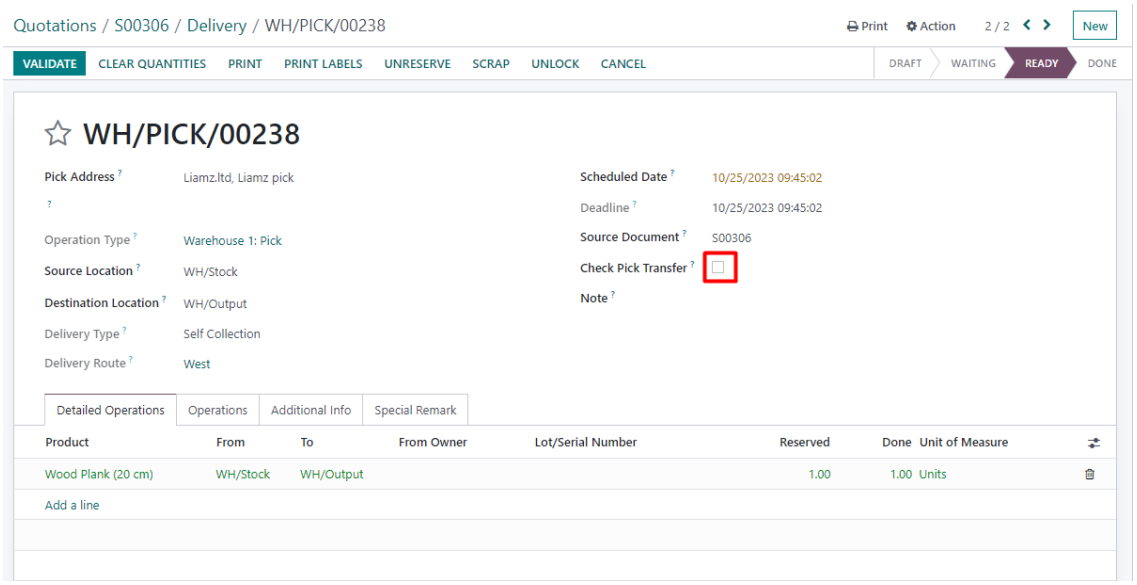
Go to Inventory modules. In inventory overview, choose pick transfer.

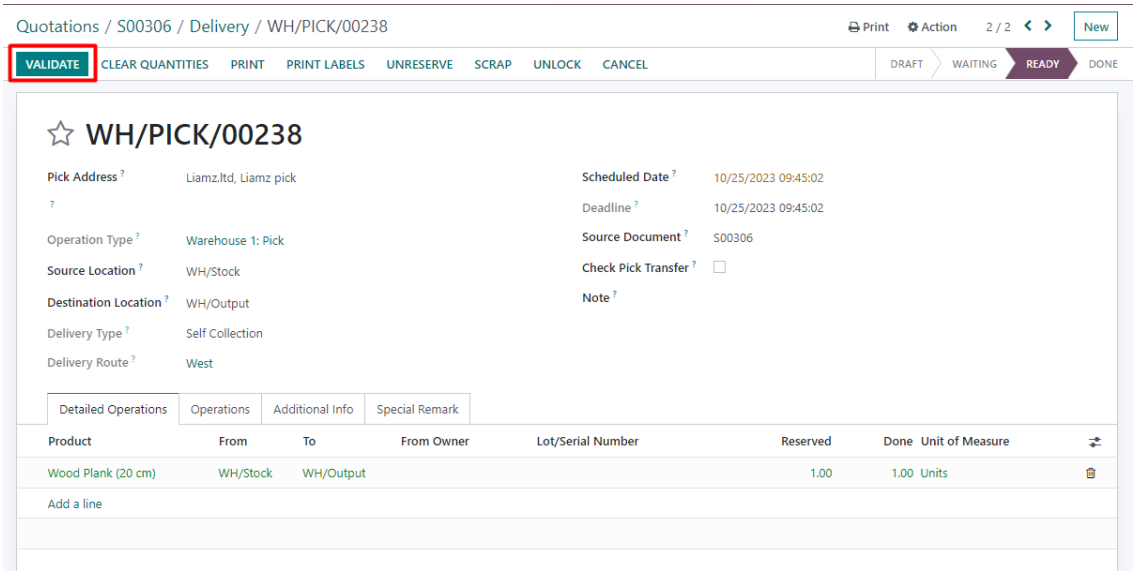


Search for the pick transfer and set the quantity

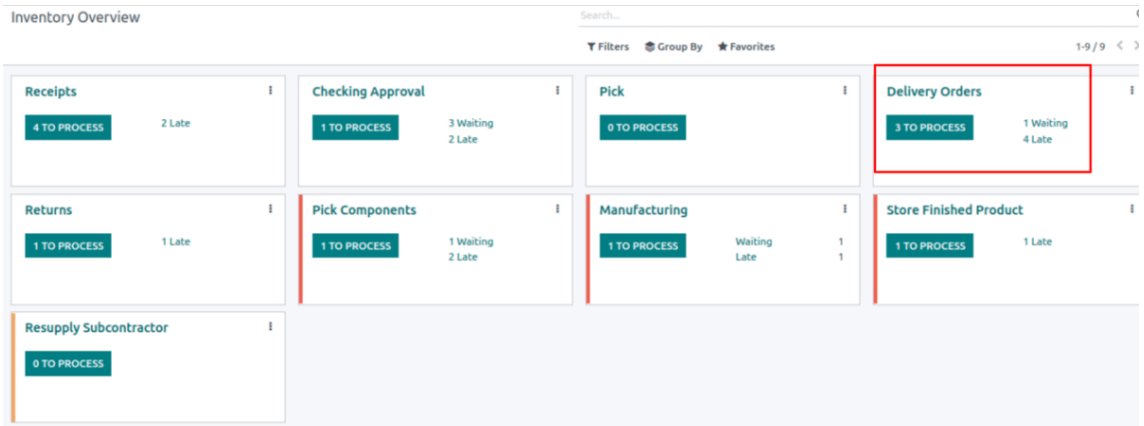


after that you can tick on the check pick transfer first and then the validate button.

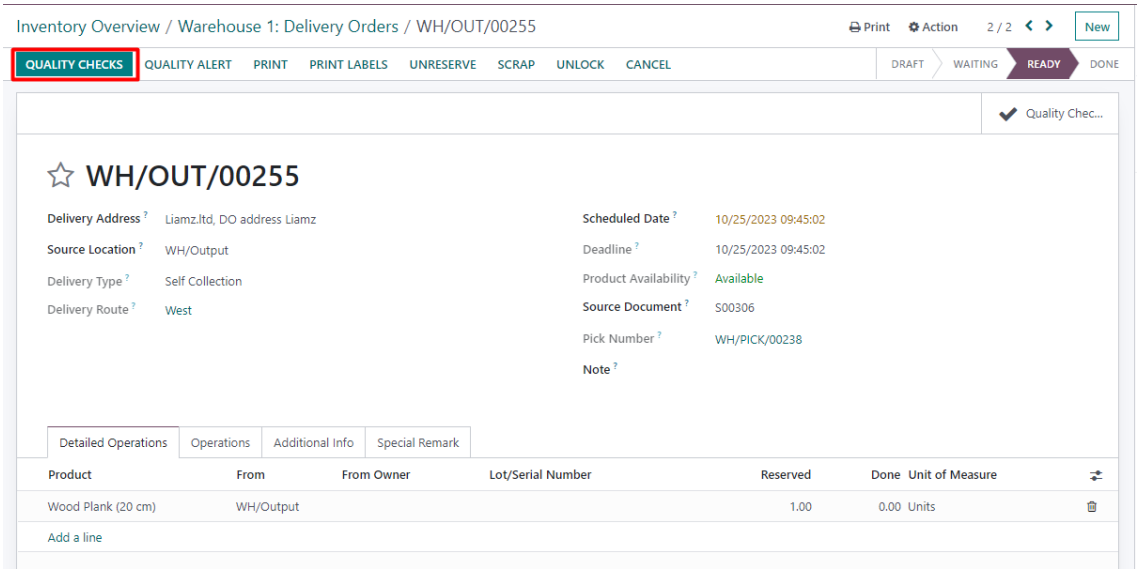




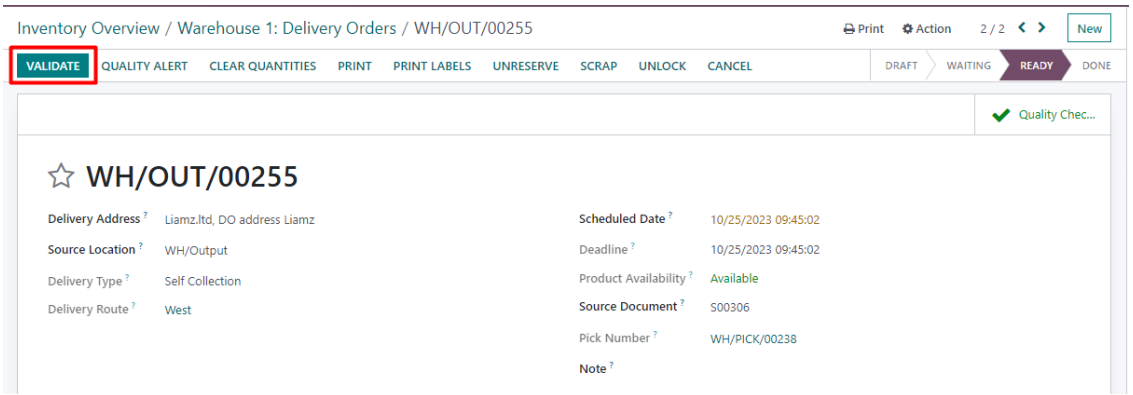
After Pick transfer is done, you can go back to inventory overview and choose delivery oder.



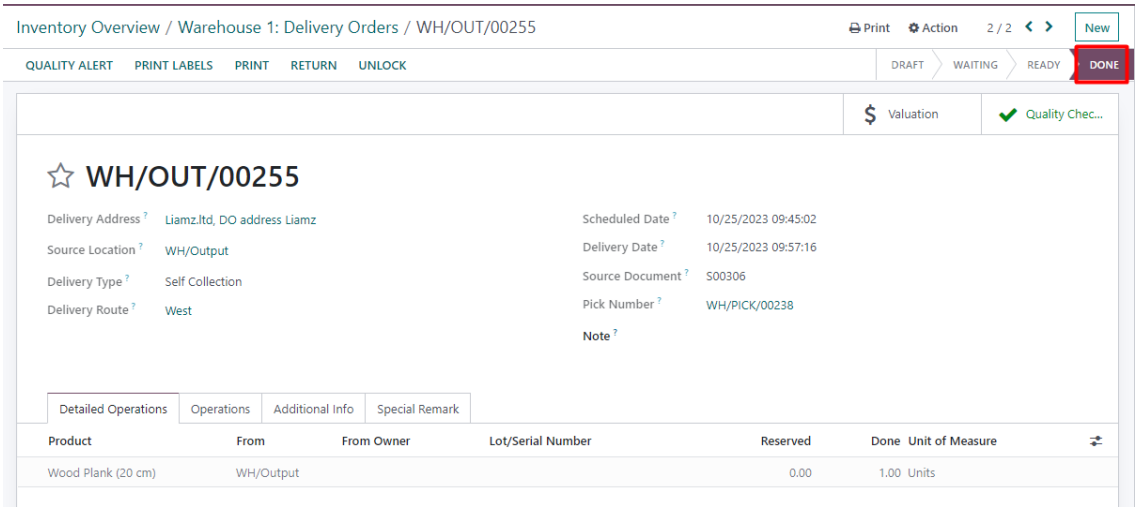
Search the transfer and wait for DO to get pass quality check/approved



After the DO pass/approved, set the quantity delivered and signed by the customer and click on validate

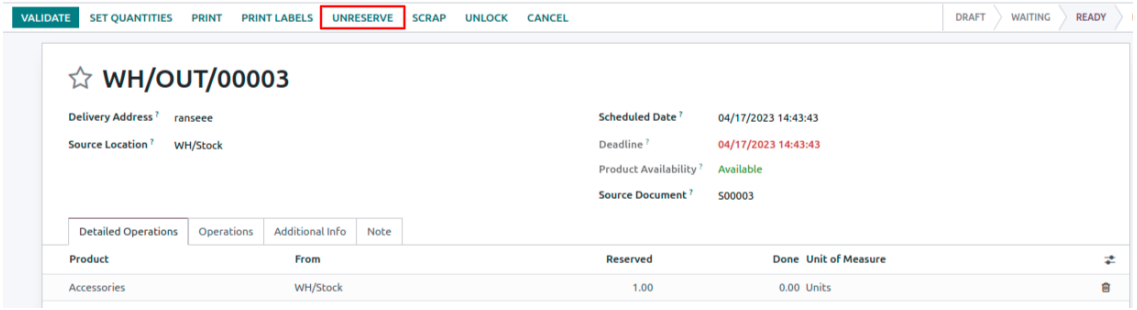


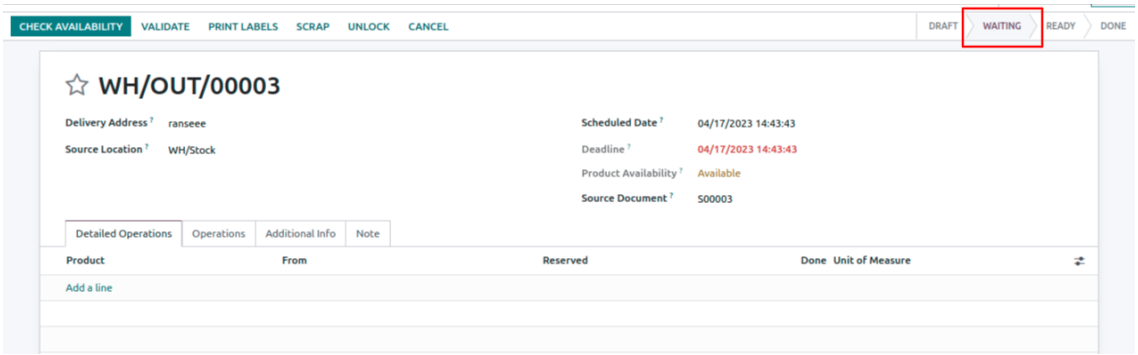
The state of delivery order will change from ready to become done.



5.9. Unreserve Product

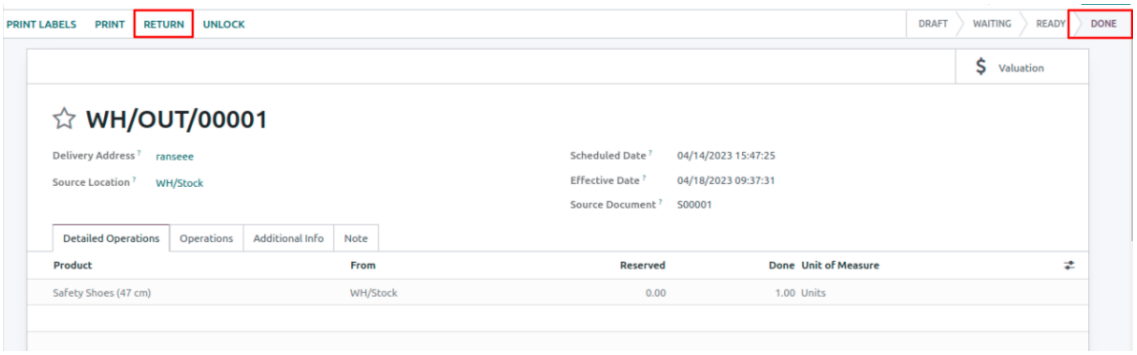
In Transfer form, if you want to unreserve. Click the unreserve button. This transfer will change the status from ready to waiting.



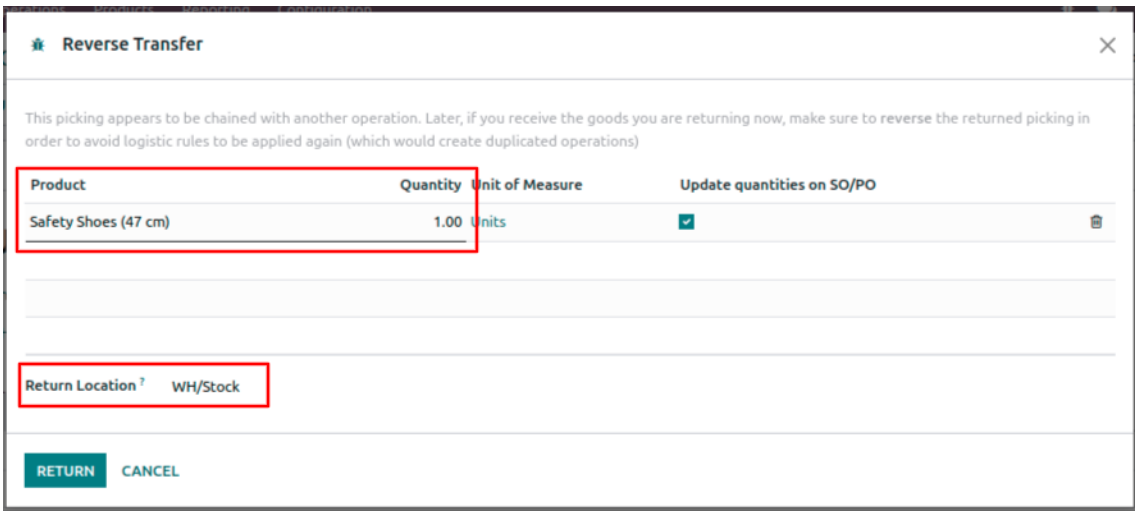


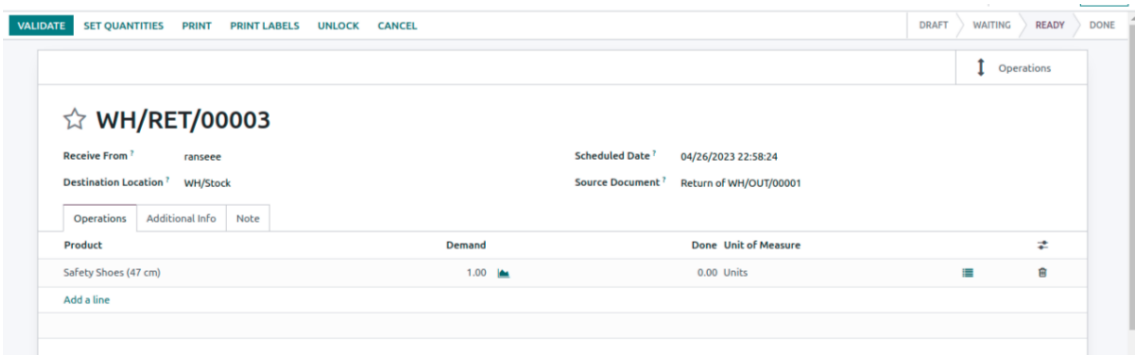
5.10. Return Product

There's two ways to return. First is return with transfer.

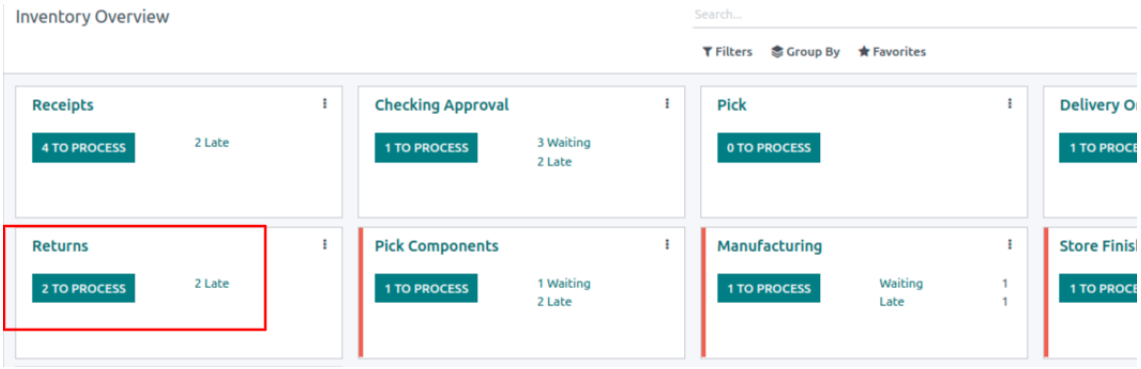


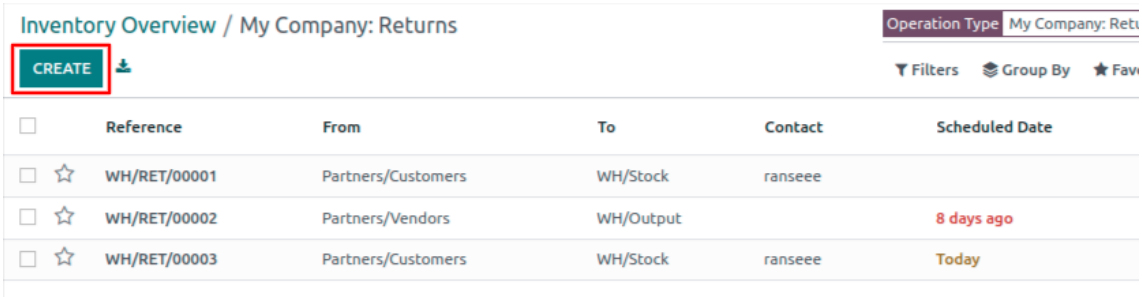
A popup will appear and display the information such as the return product, quantity, UOM, and the return location



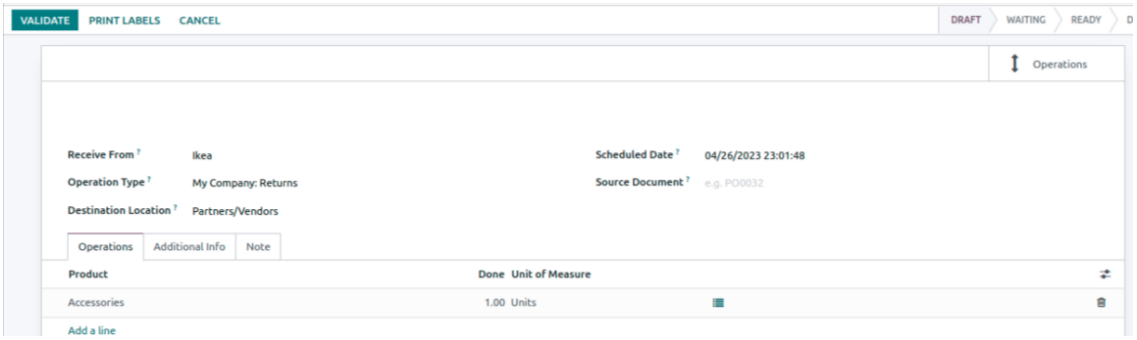


Second, you can create a return without transfer. Go to inventory modules > in inventory overview choose a return. Then Click the create button.

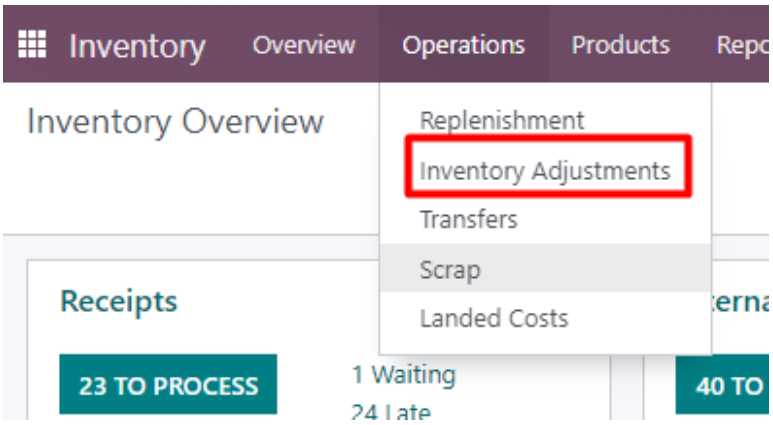


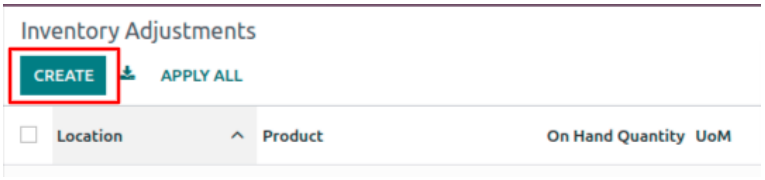


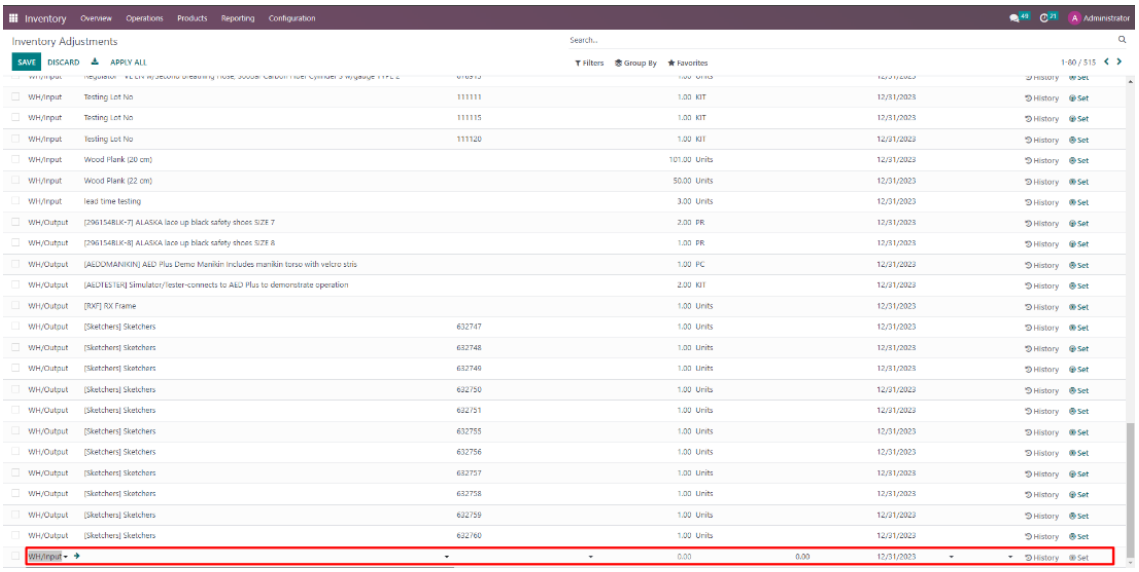
after clicking on the create button you will be move to this return page



5.11. Inventory Adjustment
Go to inventory modules > Operations > Inventory Adjustment.

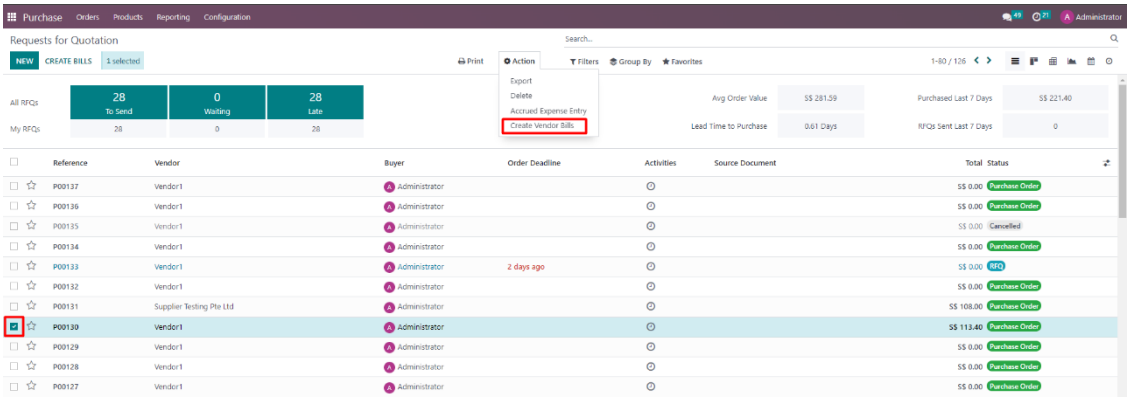




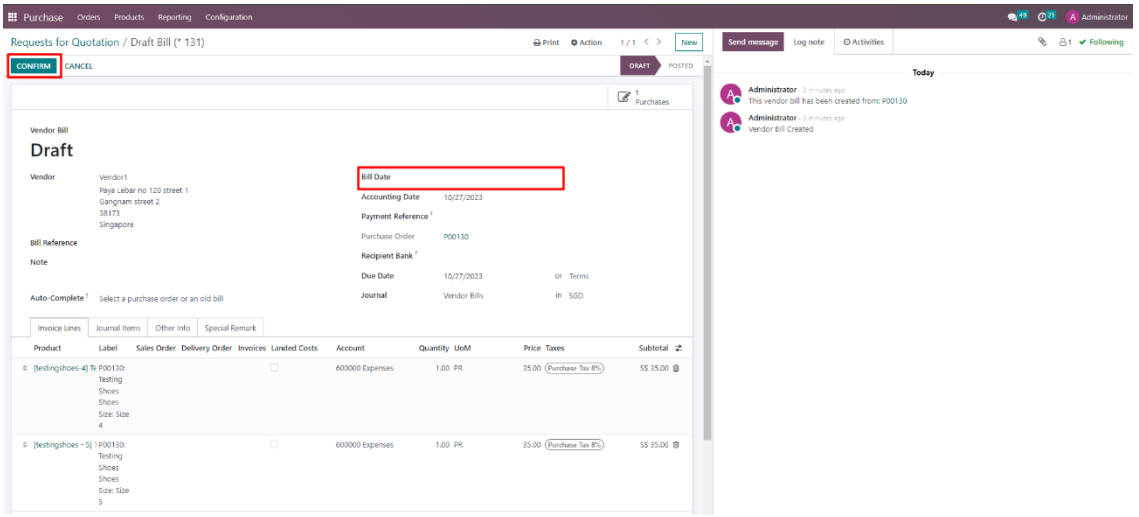


5.12. Overseas Product

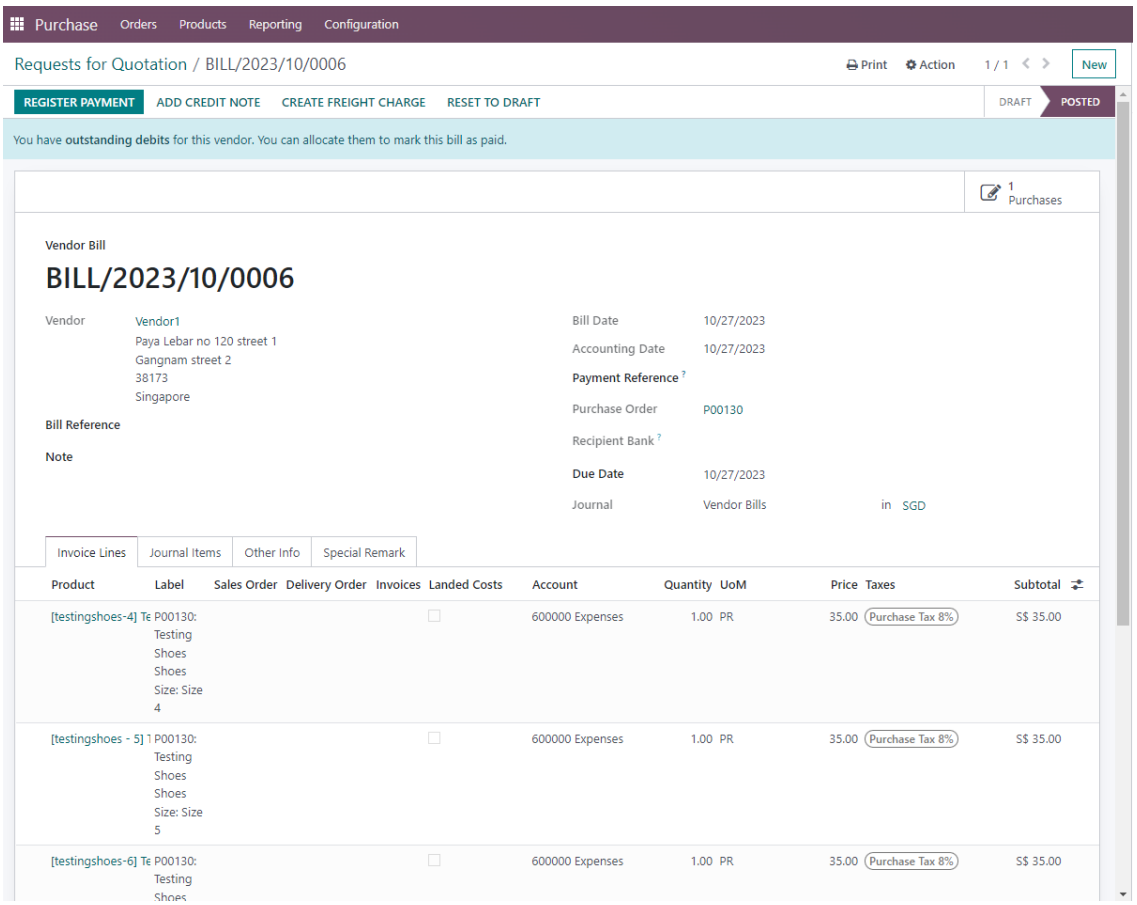
In purchase order listing, you can select the po with same vendor. Go to action > create vendor bill



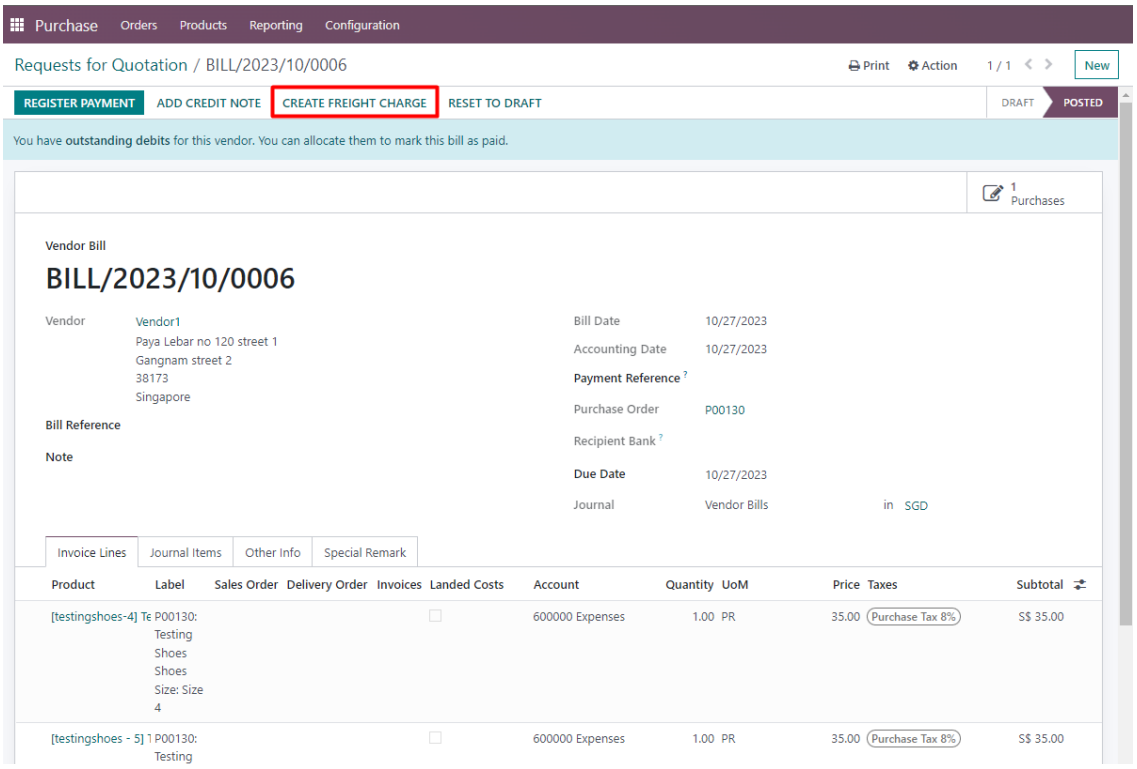
System will create create a draft bill, enter the bill date and click on confirm to confirm the draft bill into a vendor bills



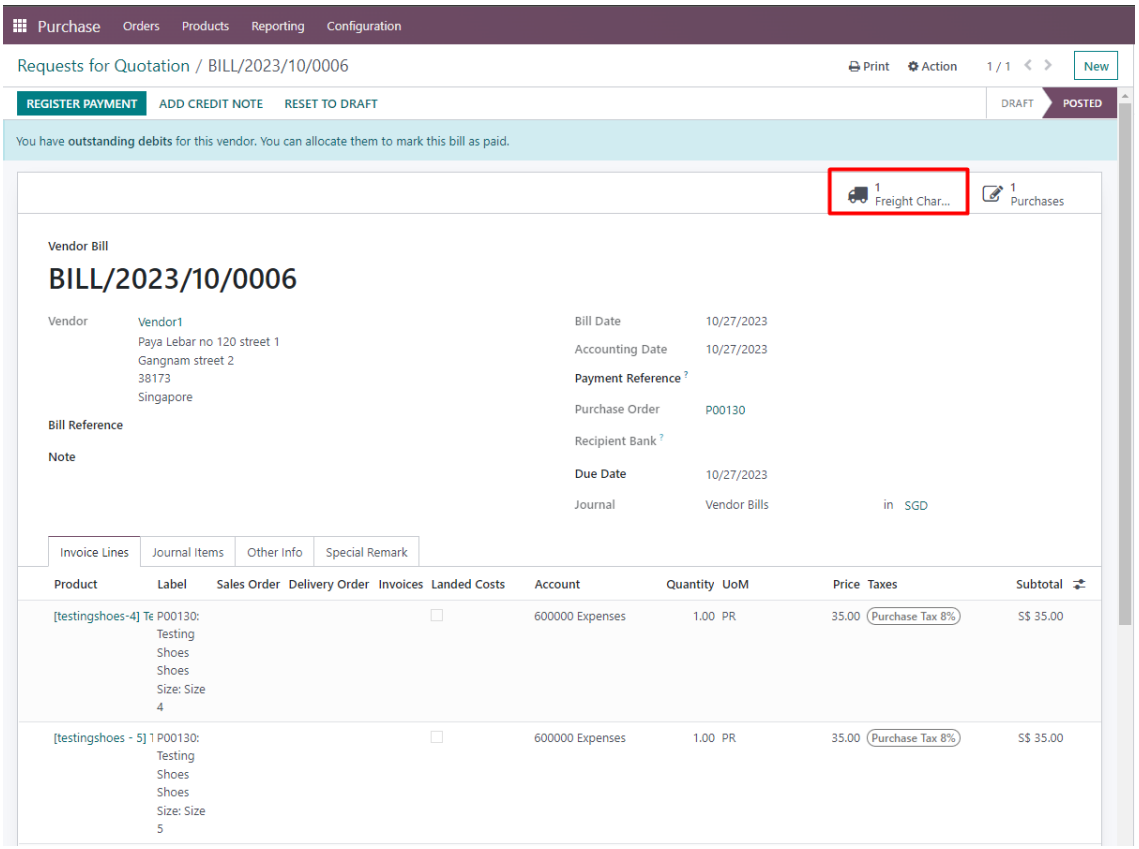
Once confirm you can see the status change from DRAFT to POSTED



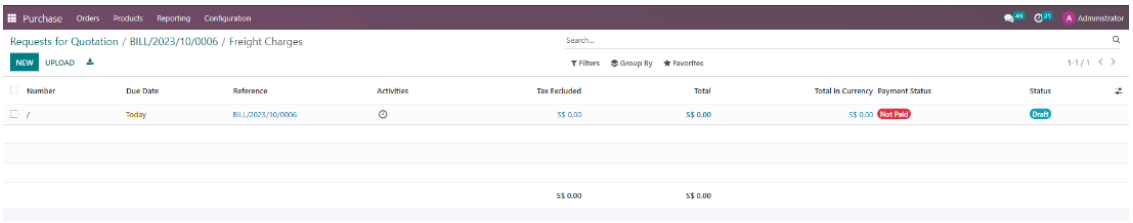
Click on create freight charge button to create a freight charge for this bill



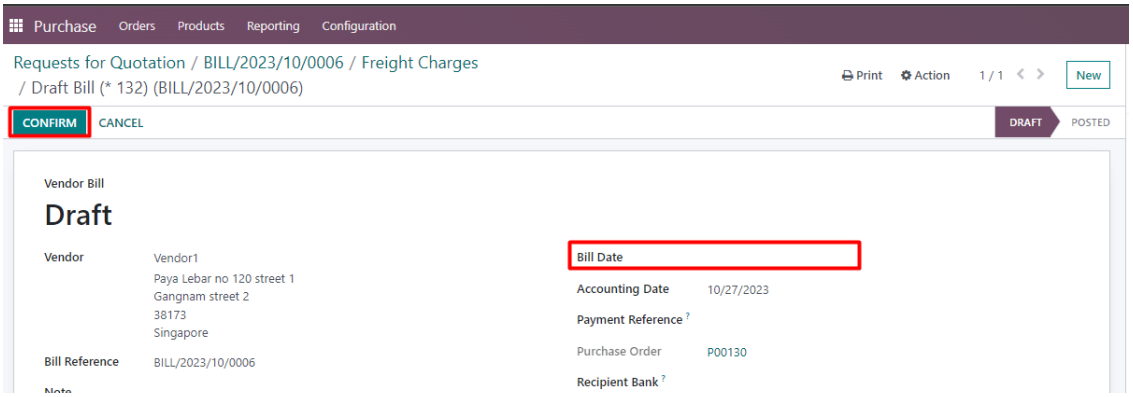
Click on the freight charge smart button to view the freight charge



Click on the freight charge to see the freight charge details

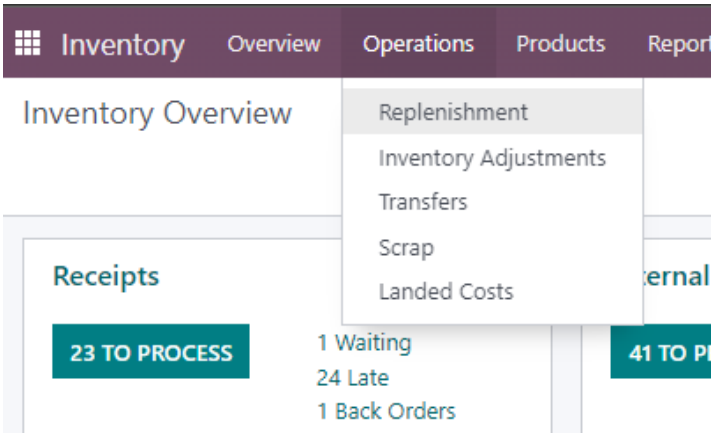


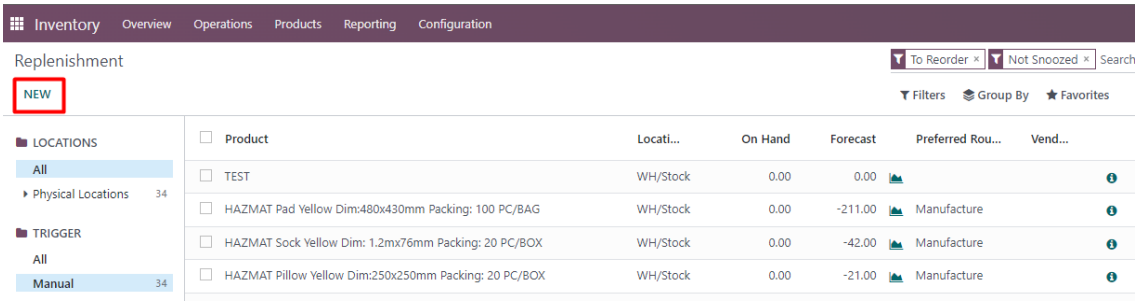
Click on the freight charge and enter the bill date and click on confirm to pay the freight charge



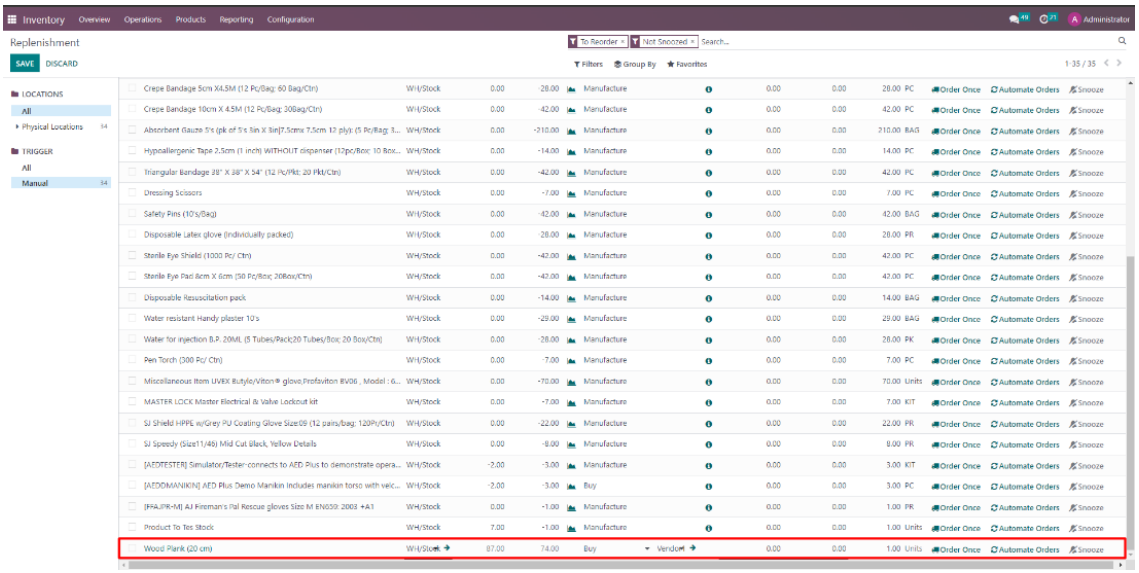
5.13. Re-ordering

Go to inventory modules. On the top menu, click Operations > Replenishment. Click the create button. Then key in the information.



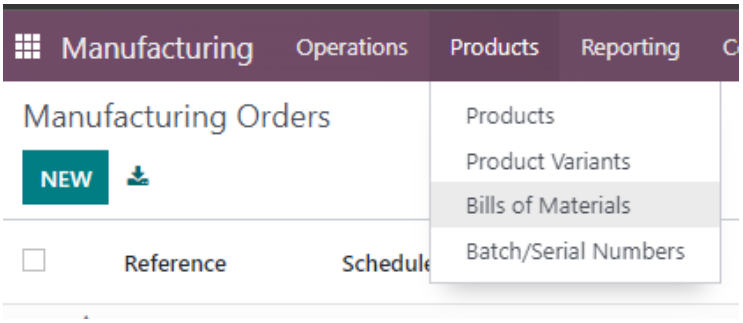


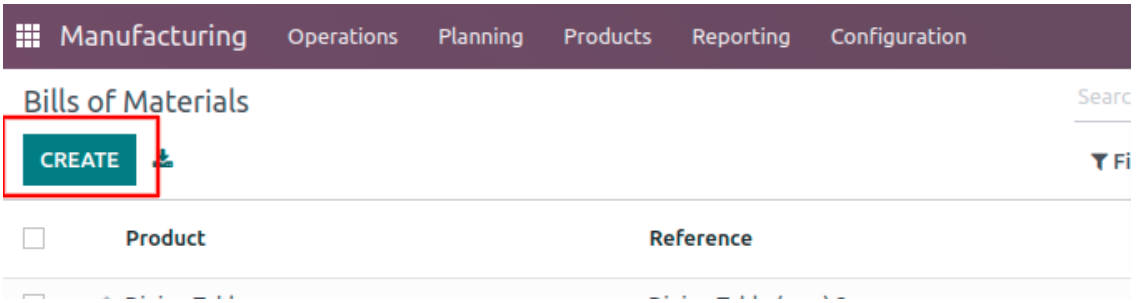
Click Order Once. The system will automatically create a Purchase Order.



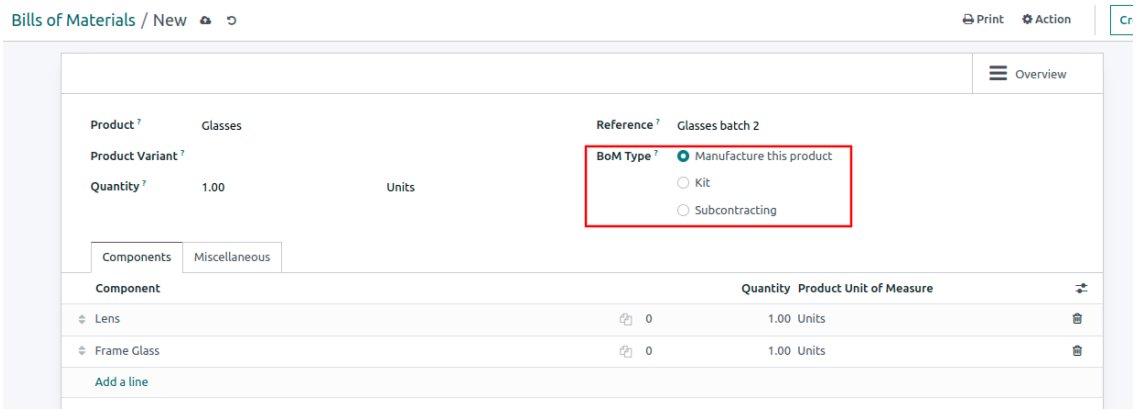
5.14. Create BOM

Go to manufacturing modules > products > Bill of Material. Click the create button.



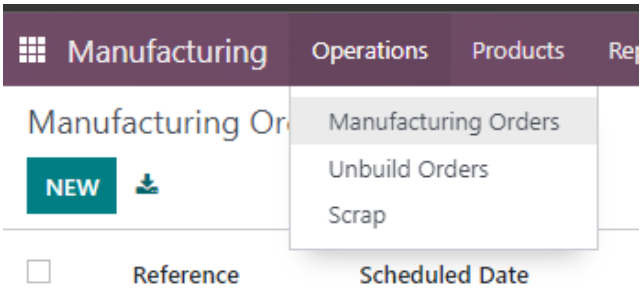


You can key in the information and select the BoM type. If you want to sell as a kit, choose kit type or if you want to manufacture the product, you can choose to manufacture the product.

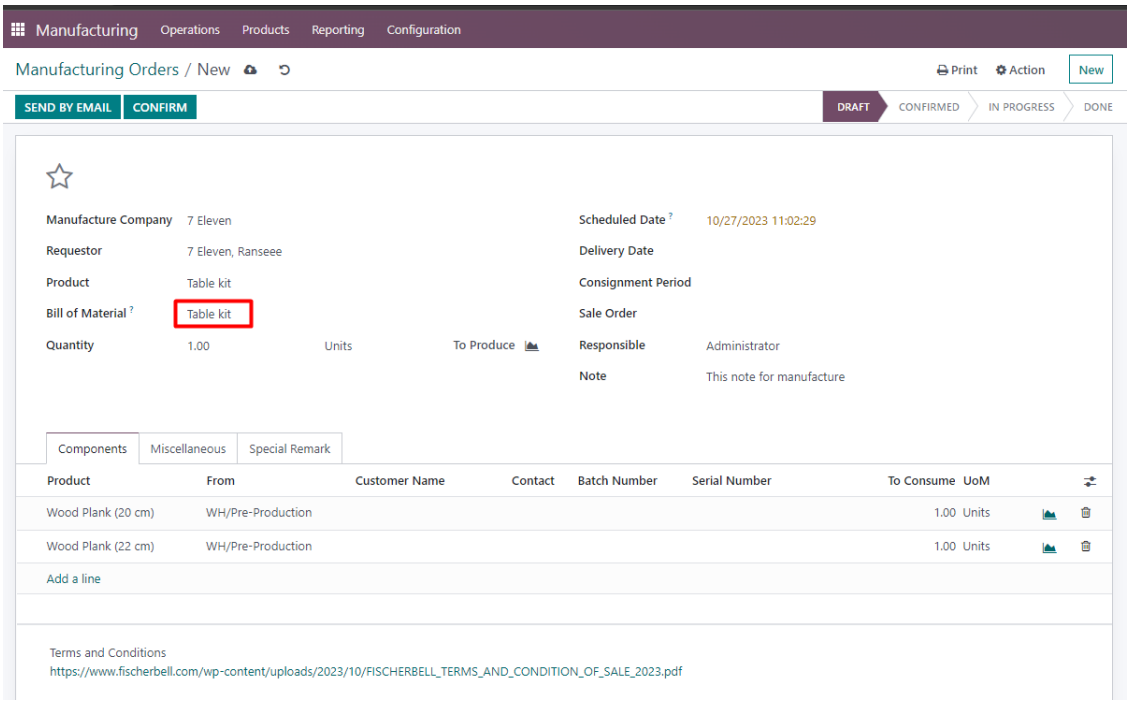


5.15. Create manufacturing order

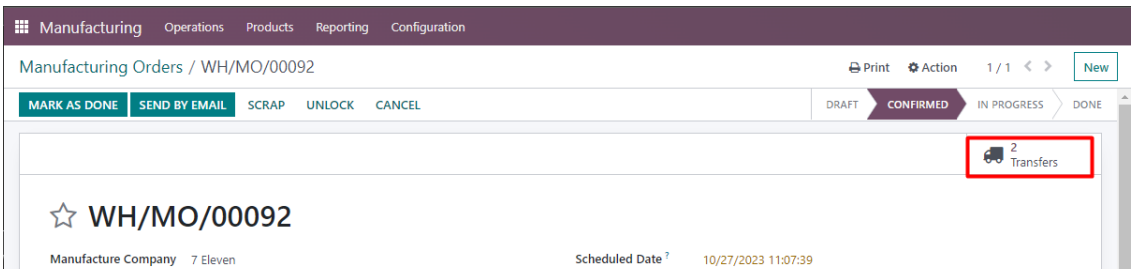
You can go to manufacturing modules. On top menu select Operations > manufacturing orders. Then click the Create button.



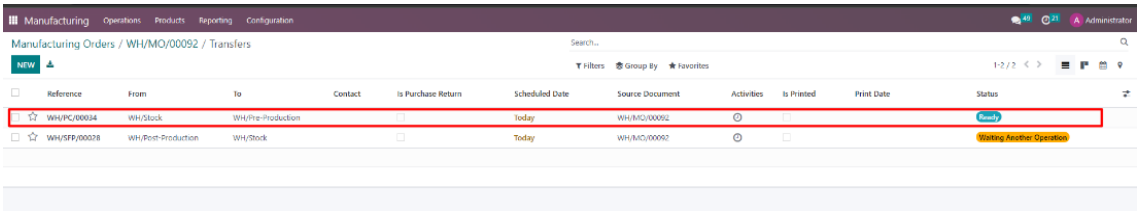
Key in the information. Also, you can select the BoM that has been created. After that click confirm button.

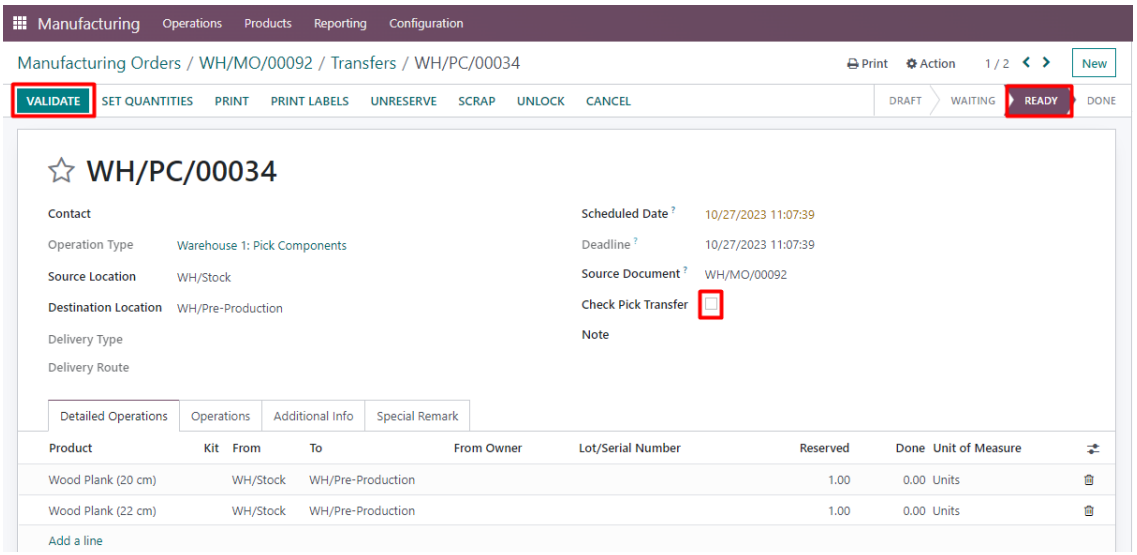


The system will automatically create a transfer. You can click the smart button to see the details of transfer.

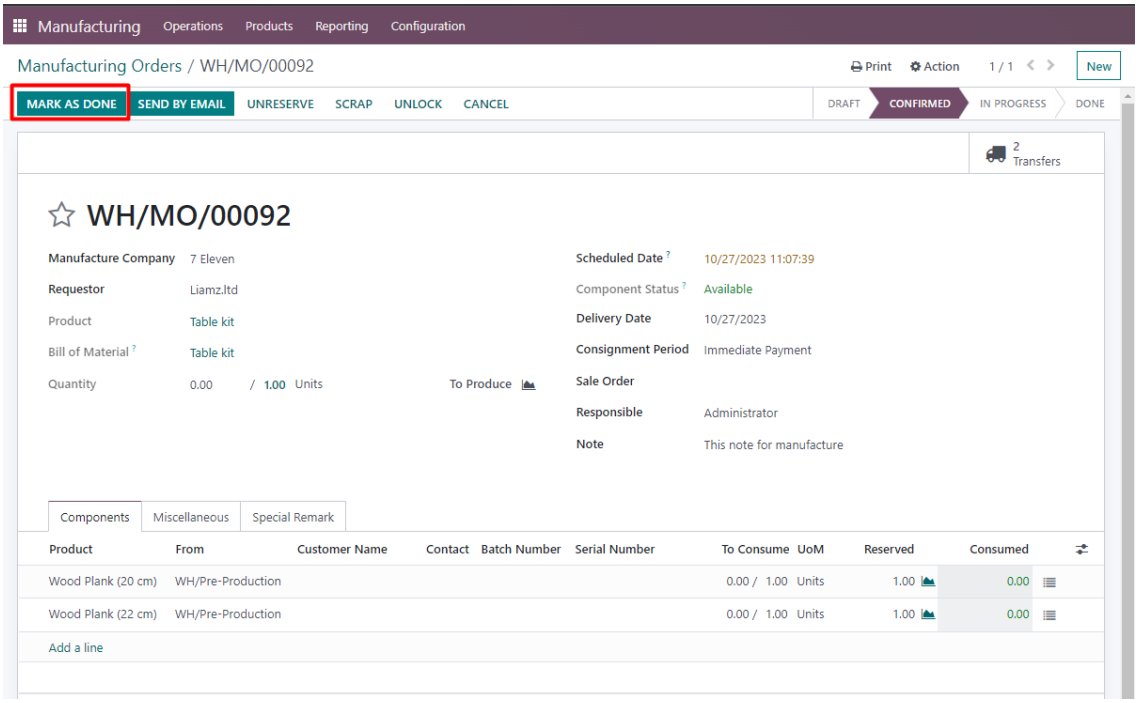


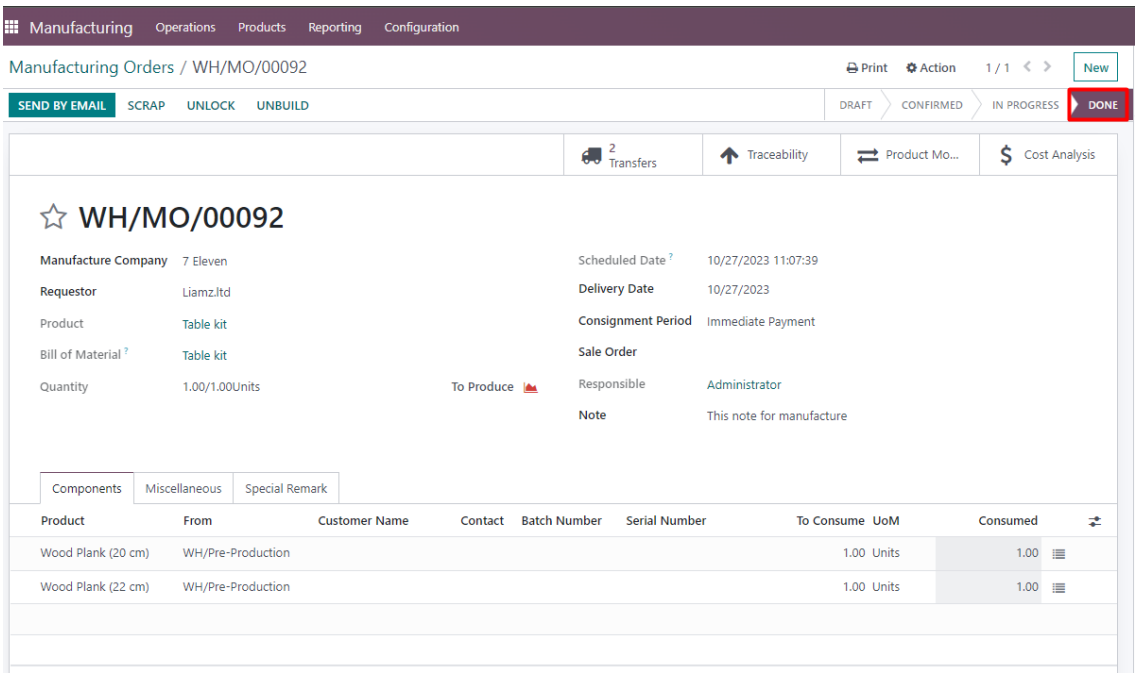
If the transfer state is ready, you can validate by ticking the check pick transfer first and click the validate button.



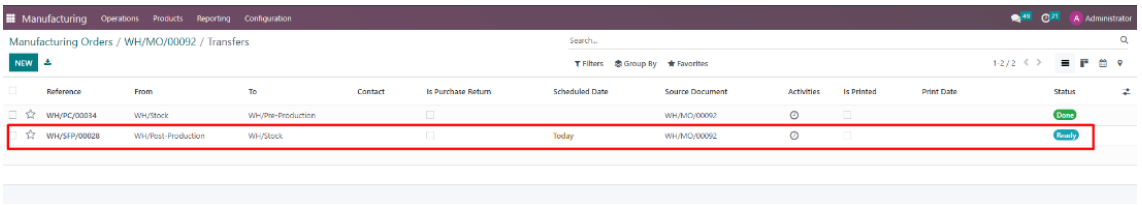


Then go back to manufacturing order, click mark as done button. The state of this MO will change from confirmed to done.

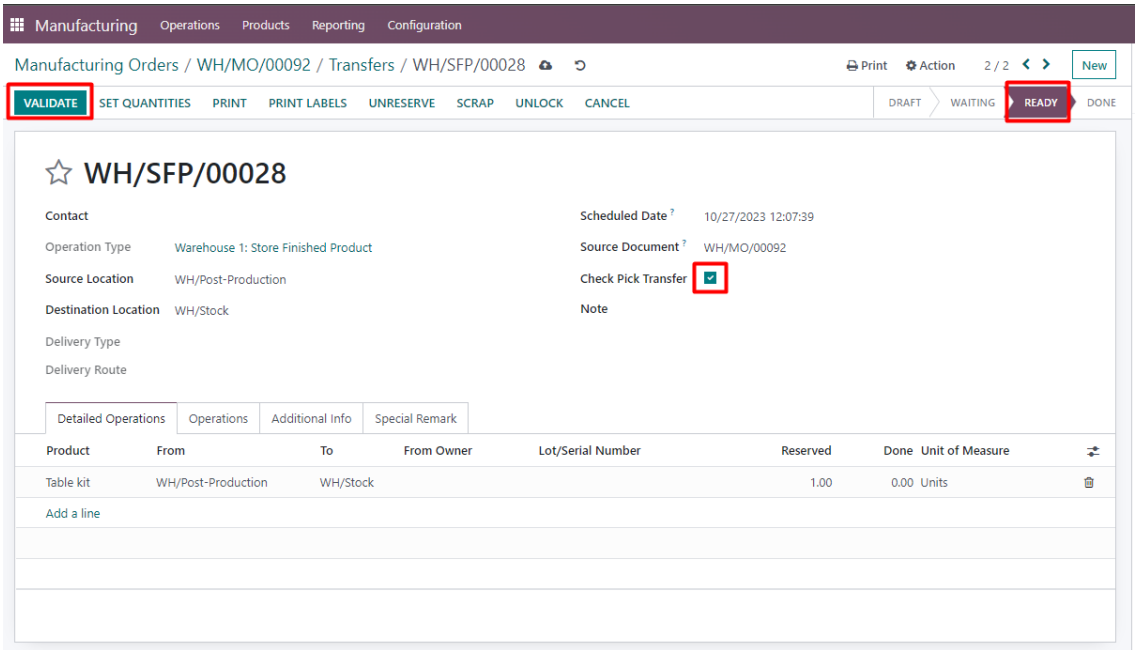




Then go to the second transfer. In this part, the stock will deliver from production to stock.

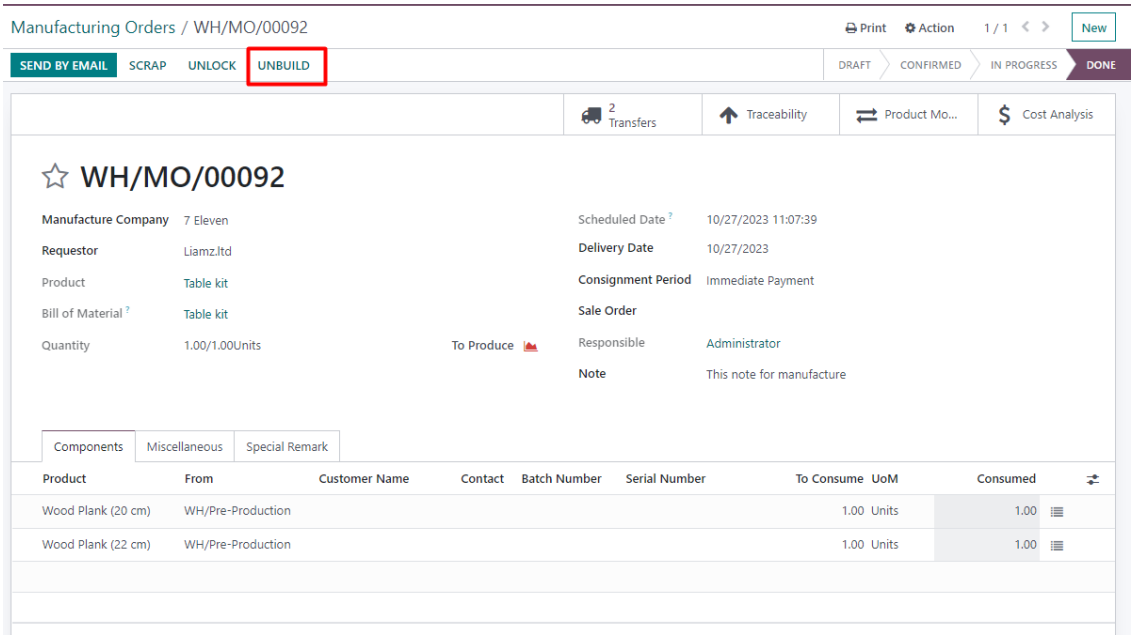


you can validate by ticking the check pick transfer first and click the validate button.

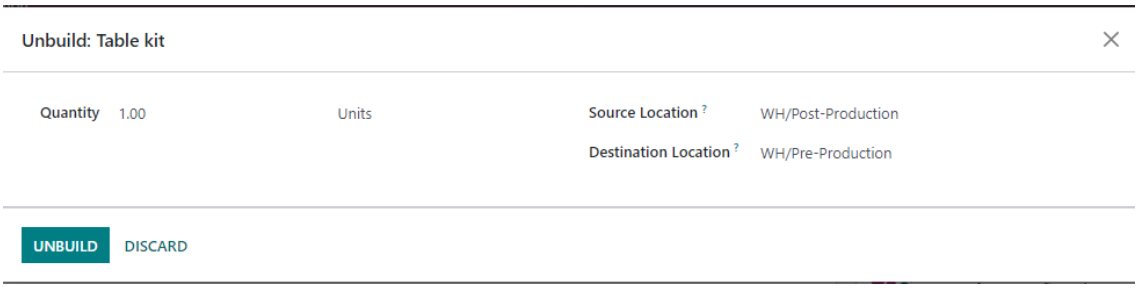


5.16. Unbuild Order

In Manufacturing module, once the MO is done an unbuild button will appear. If you want to unbuild the product, you can click the unbuild button.



System will show you a wizard. You can key in the location and click the unbuild button.



System will unbuild the product. Click the smart button unbuild to see the details or you can go to Operations Menu > Unbuild Orders.

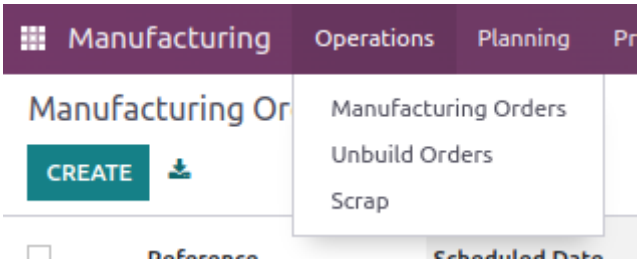
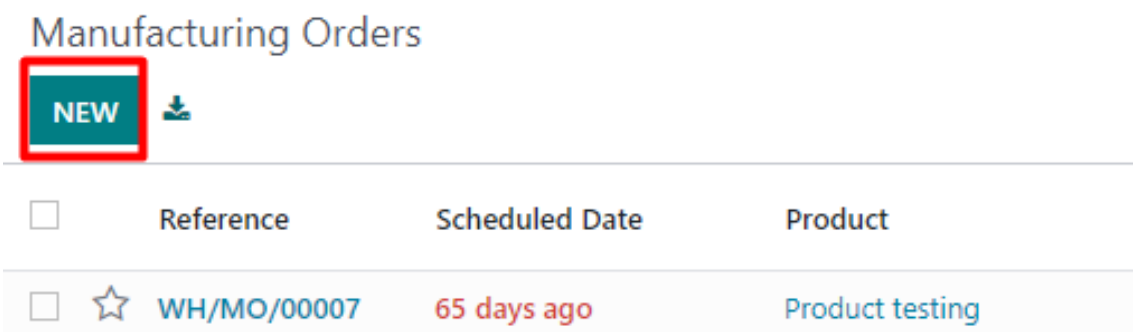
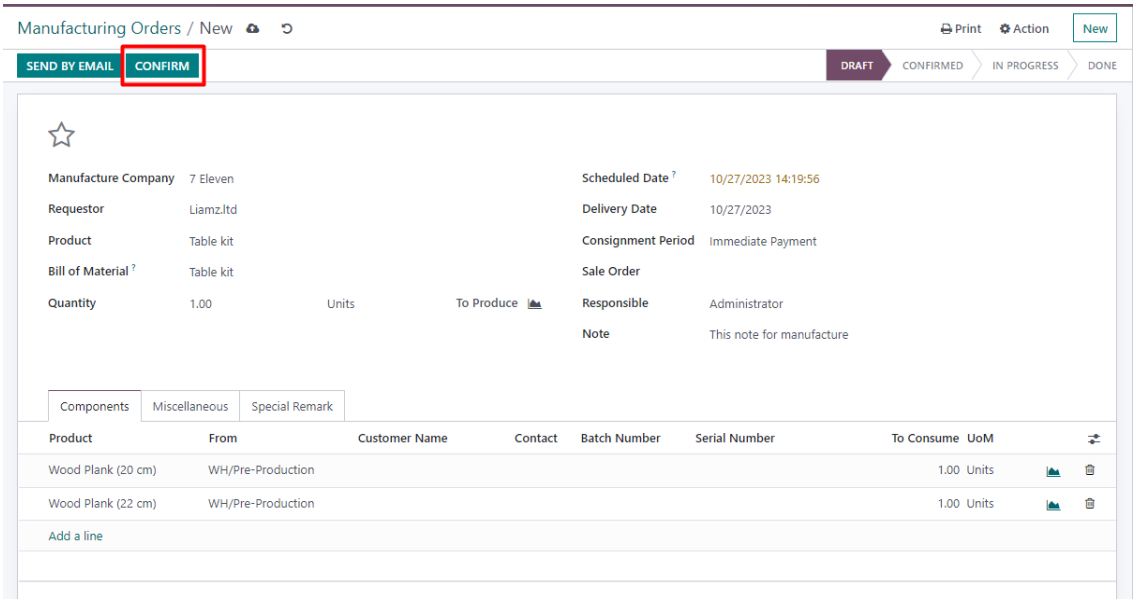
5.17. Outsource Assembly

Go to manufacturing modules. On top menu click manufacturing orders menu and click create button.

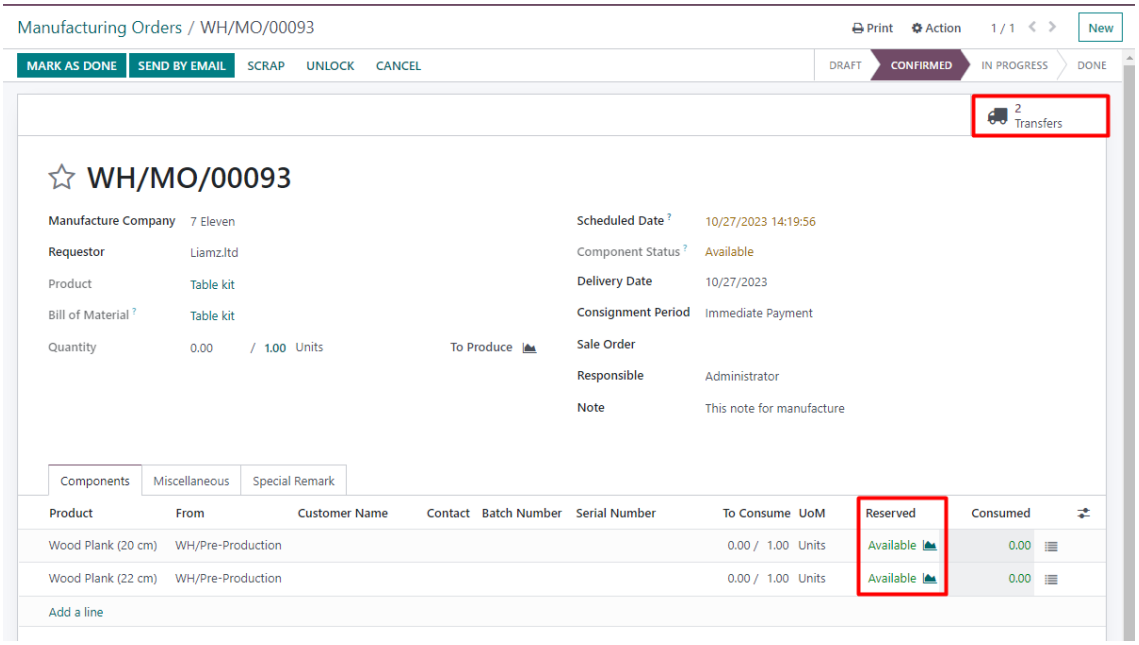




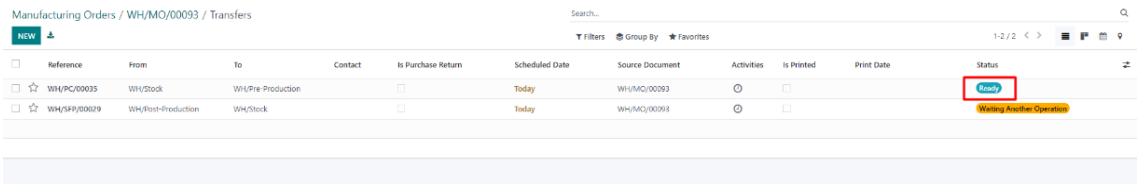
Key in the information and the product. Click the Confirm button.

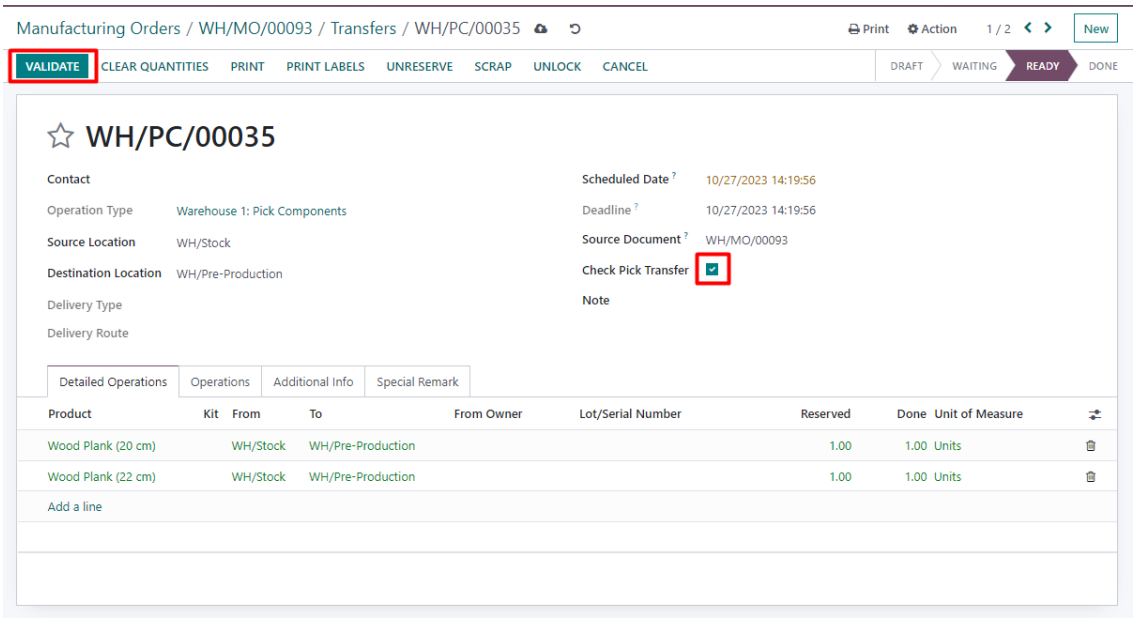


The system will create 2 transfers.

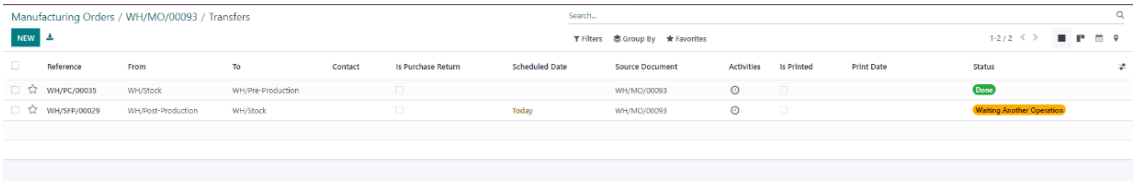


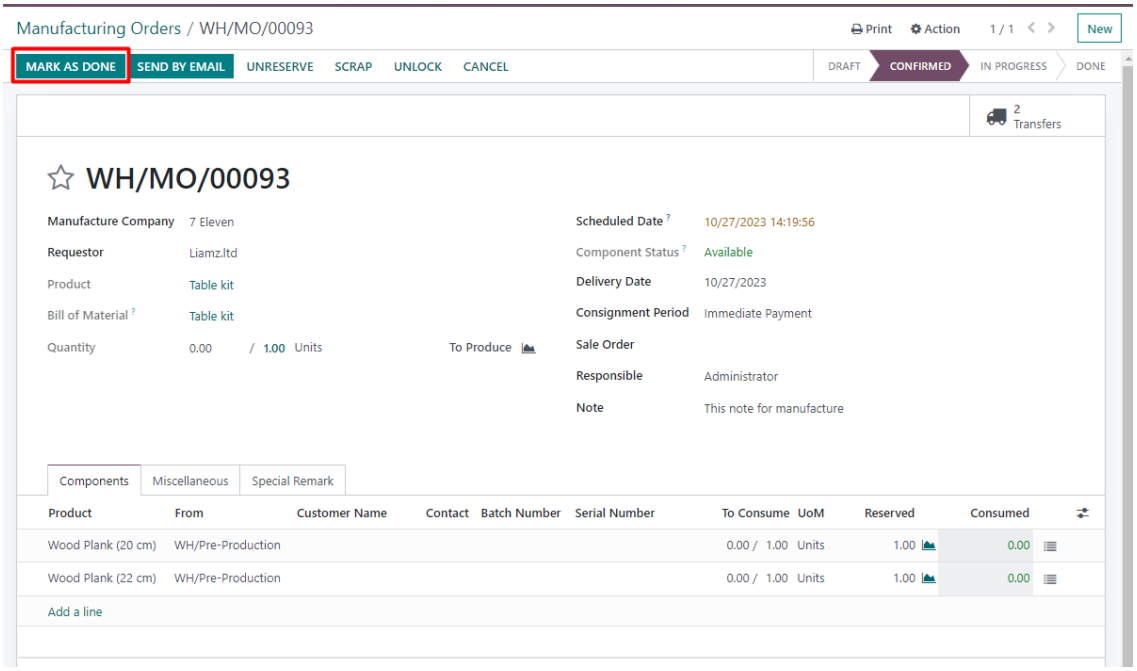
If the first transfer state is ready, you can set the quantity done and click validate button.



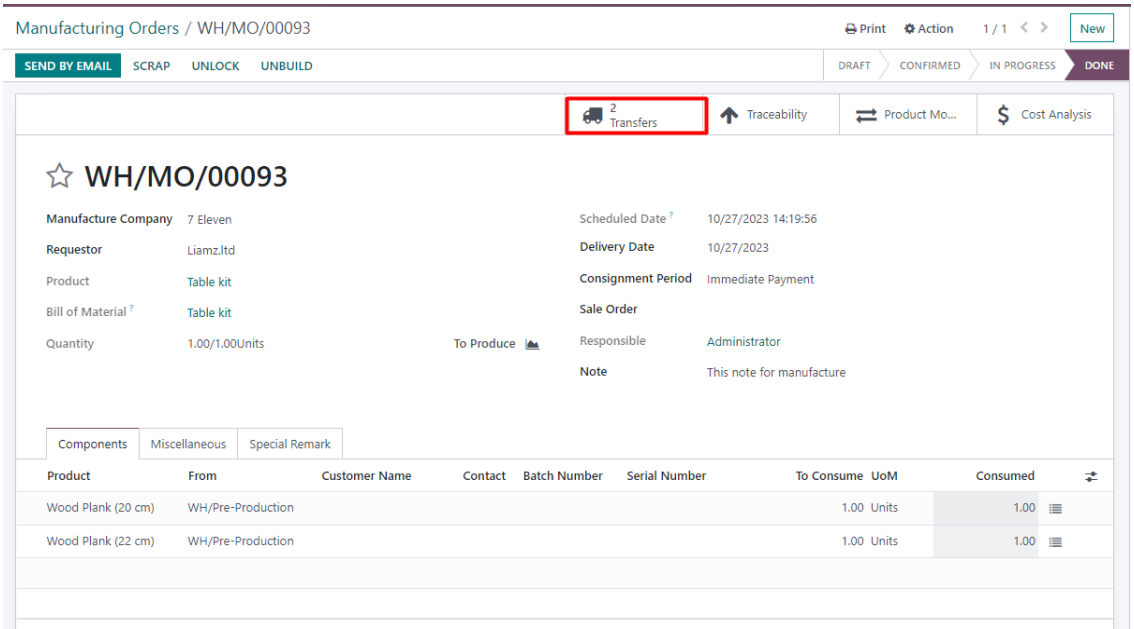


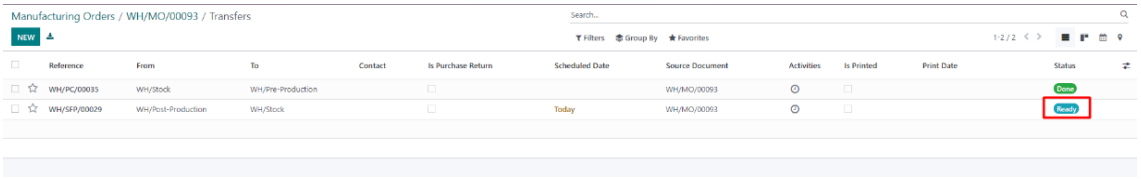
After the first transfer is done. You can go back to manufacture orders and click the button “mark as done” button. Which is the manufacture has been done.



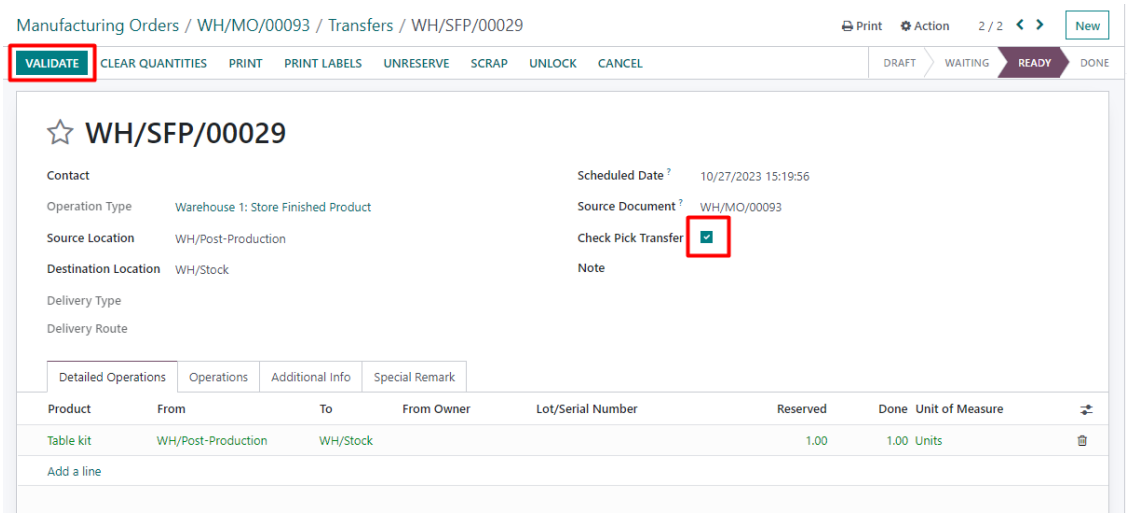


Then go to the second transfer. In this part, the stock will deliver from production to stock.





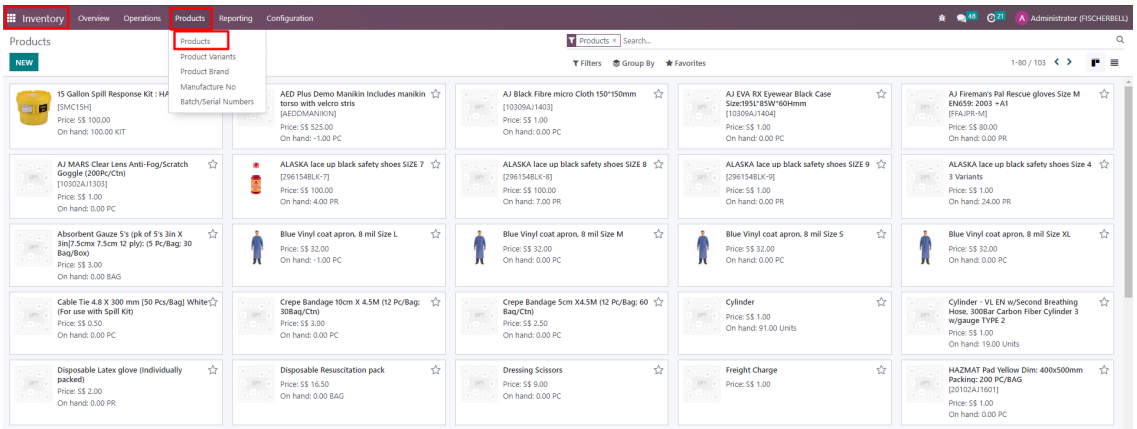
Tick the check pick transfer and click validate button.

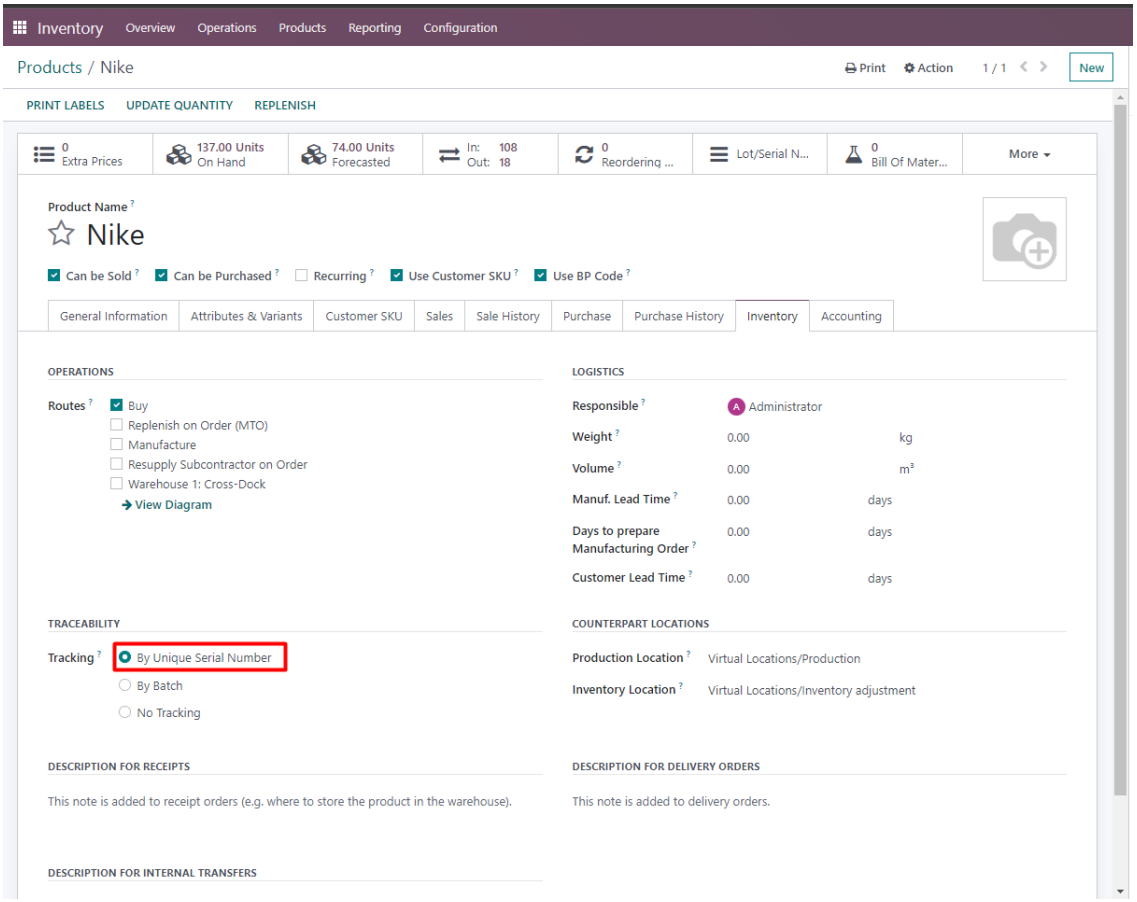


Then the transfer will be done.

5.18. assign serial number to product

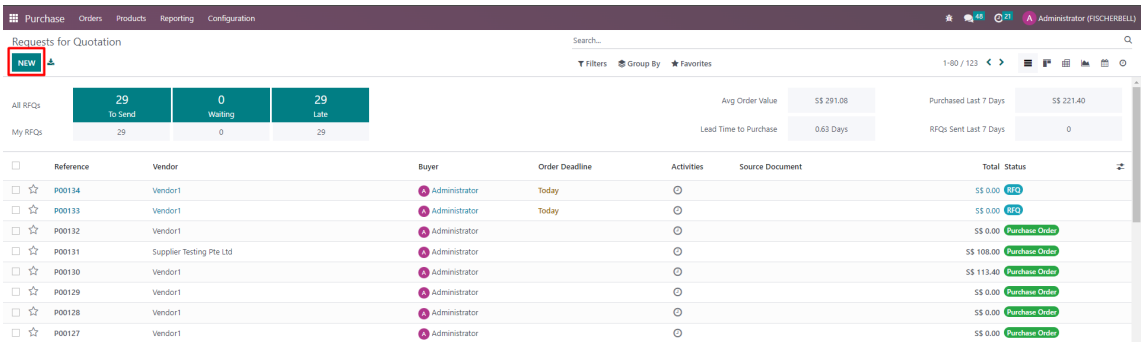
Go to Inventory > product > product that you want to have serial number, make sure the product is set to tracking by serial number

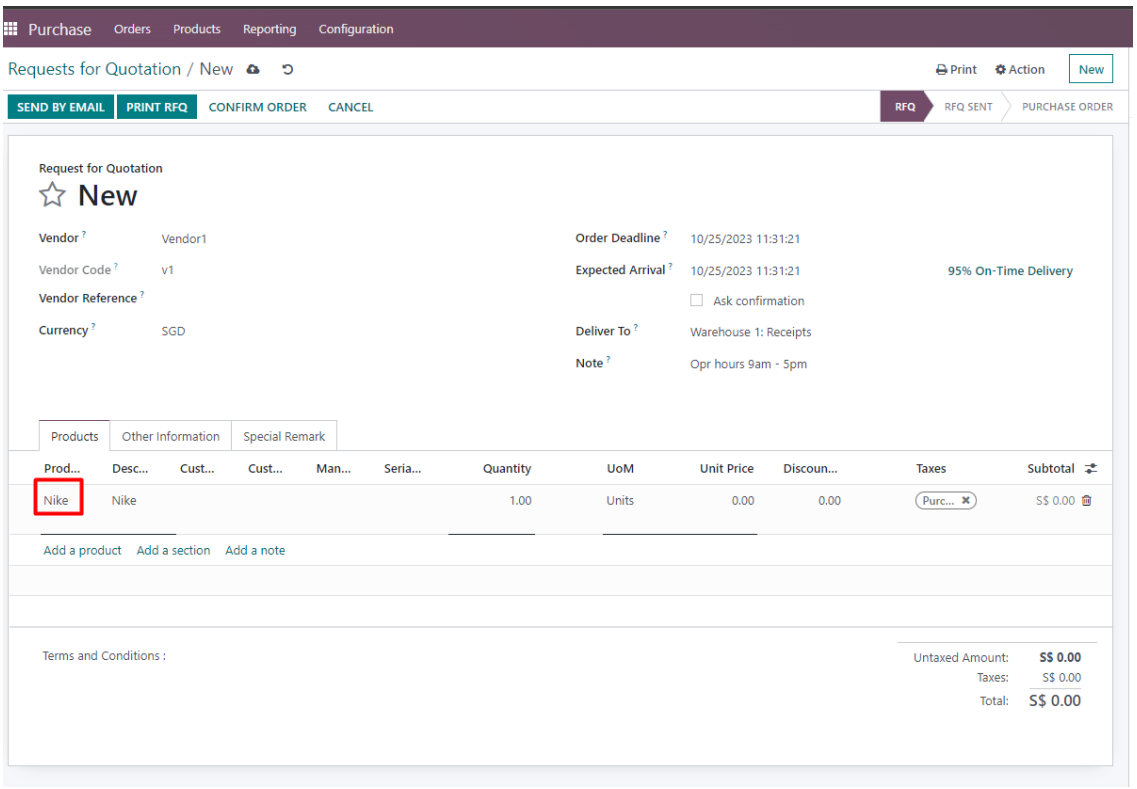




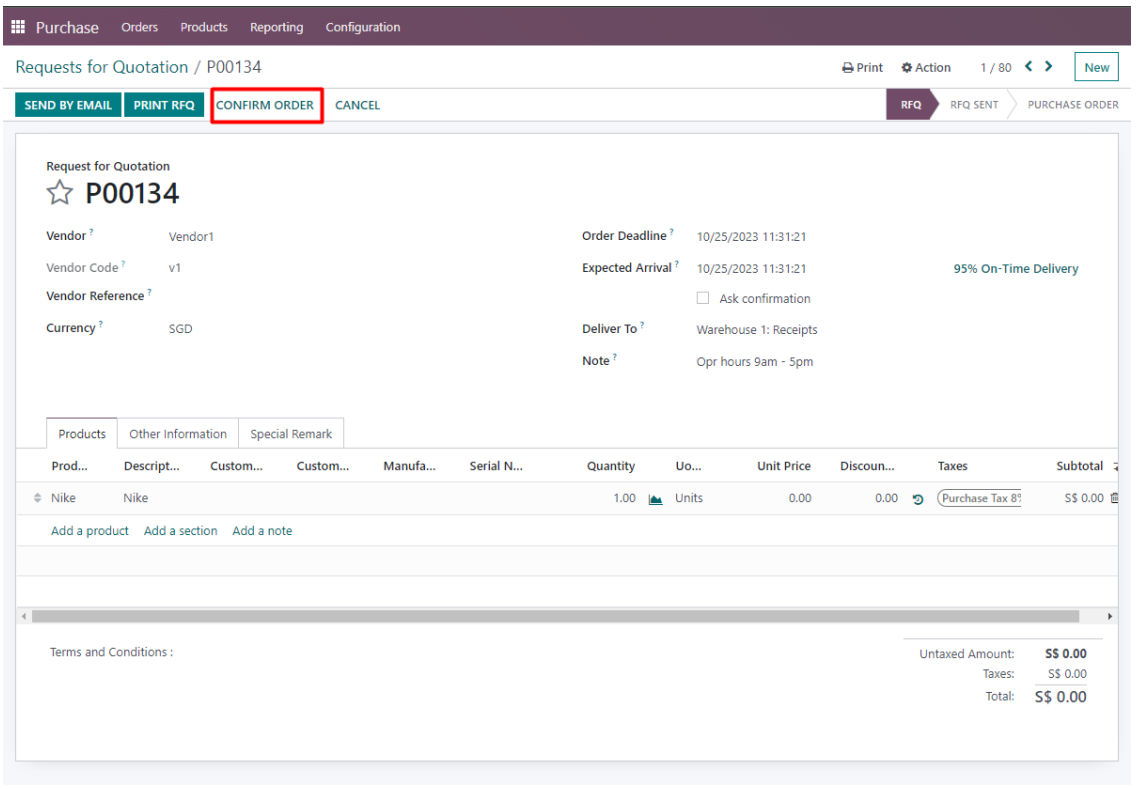
Go back to the dashboard and go to to the purchase module

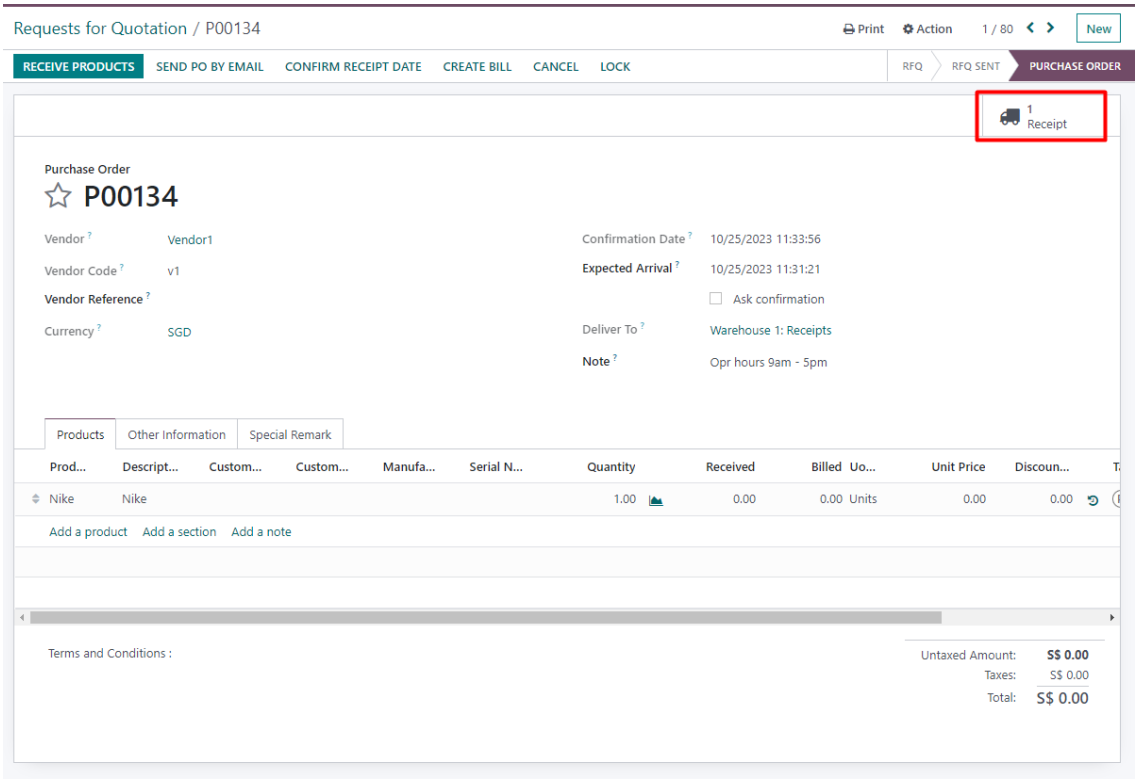
make a PO for that product



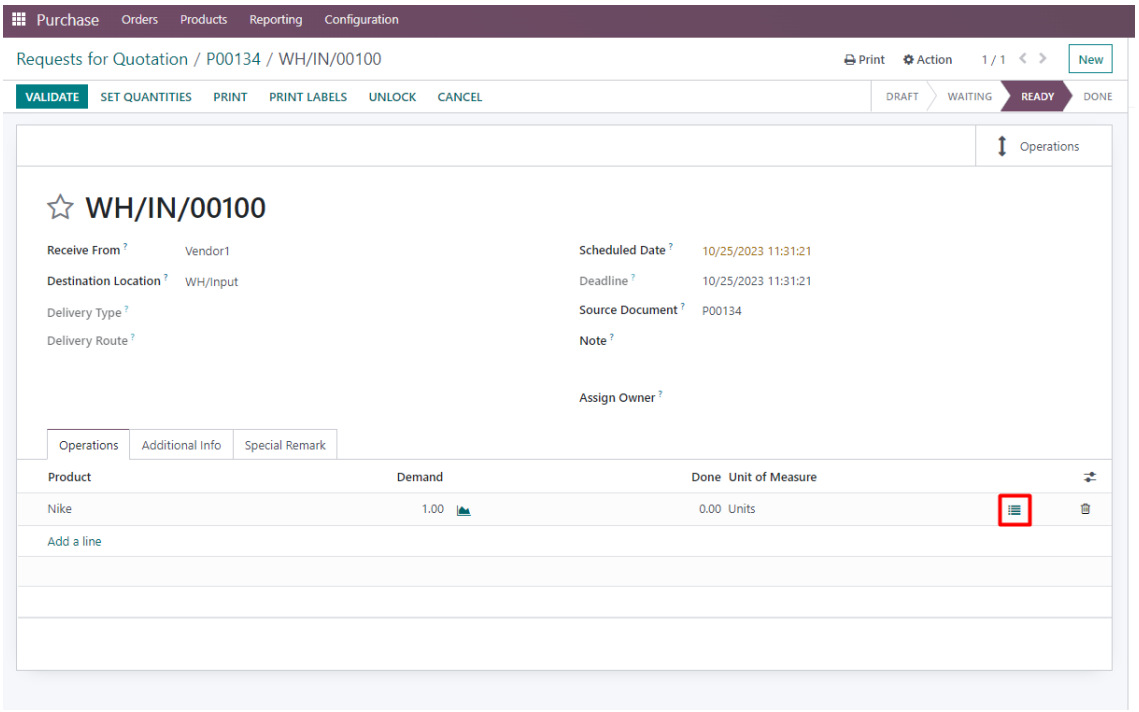


Confirm the PO, and click on received product or receipt

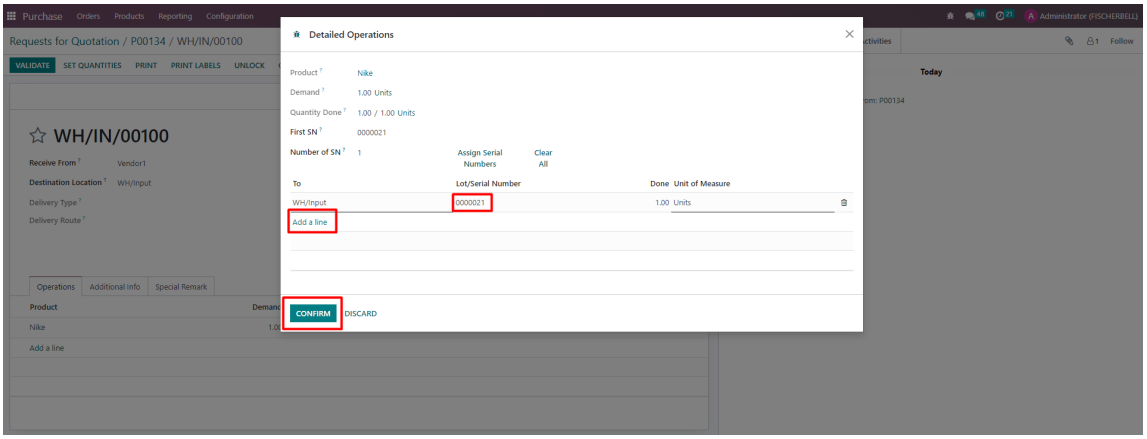




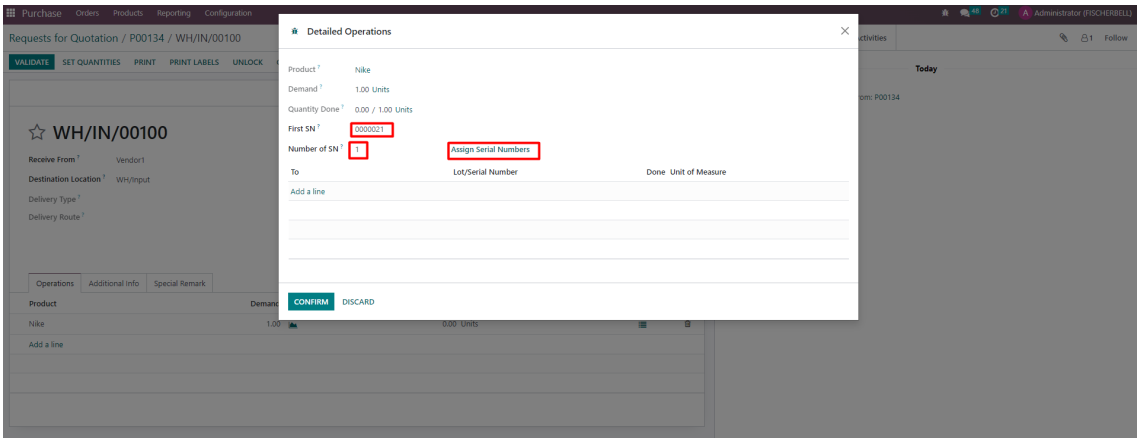
In receipt click on this icon

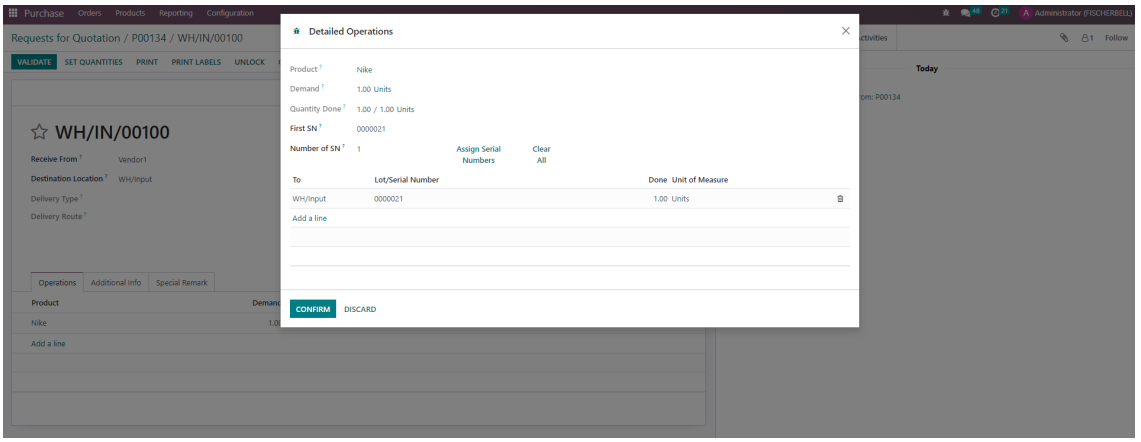


And assign your serial number through key in, by clicking on add a line and key in the serial number

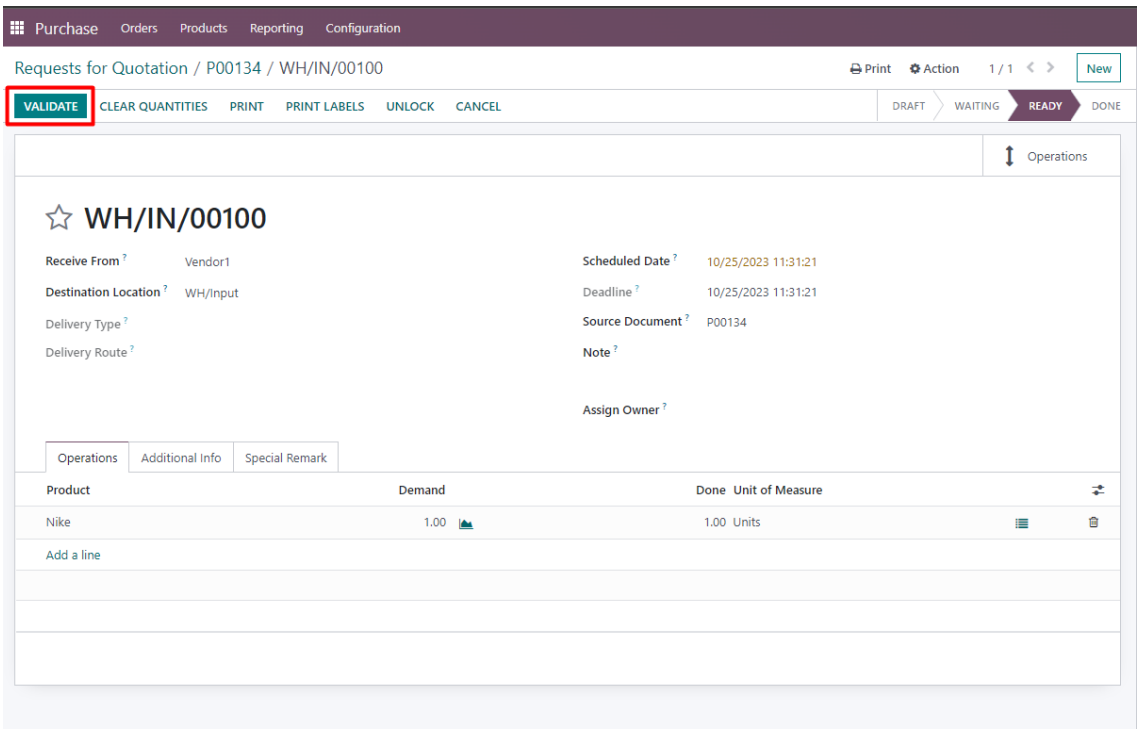


Or in the case if the product qty is 1 or more than 1 you can key in the starting serial number here and click assign serial number which will allow the system to automatically assign all of them with their own serial number



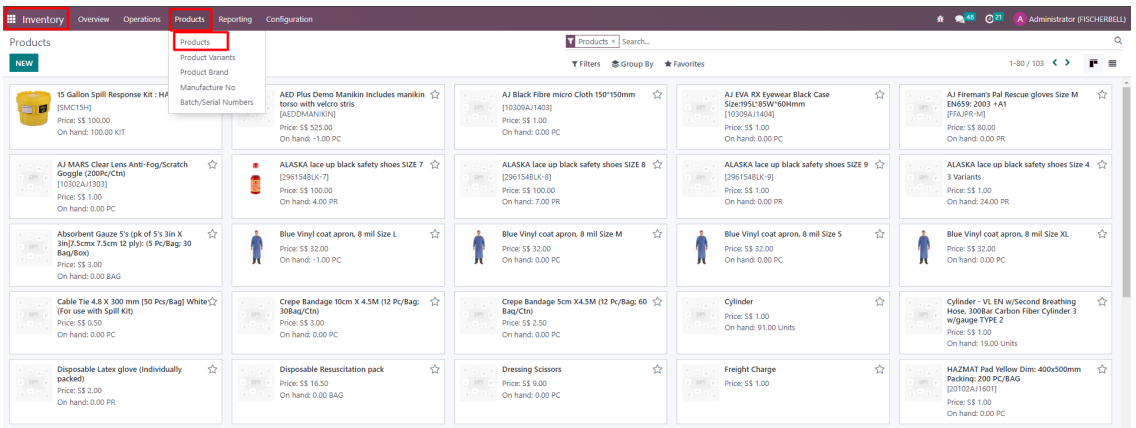


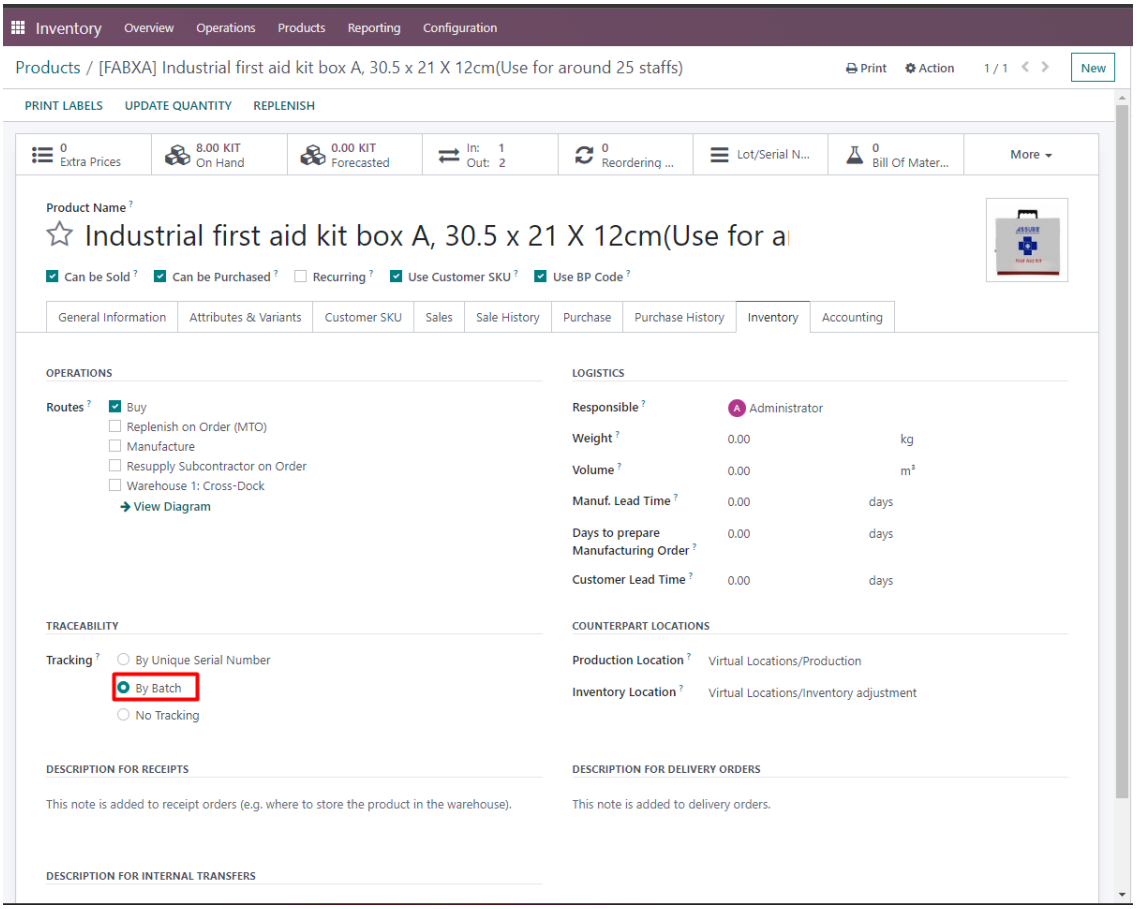
Proceed to click on confirm and click on validate



5.19. assign batch number to product

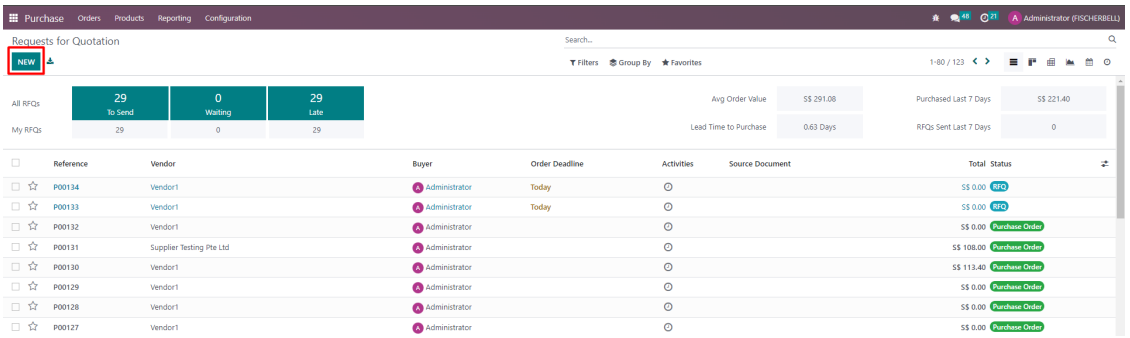
Make sure the product is set to tracking by Batch, by going to Inventory > product > product that you want to have Batch number



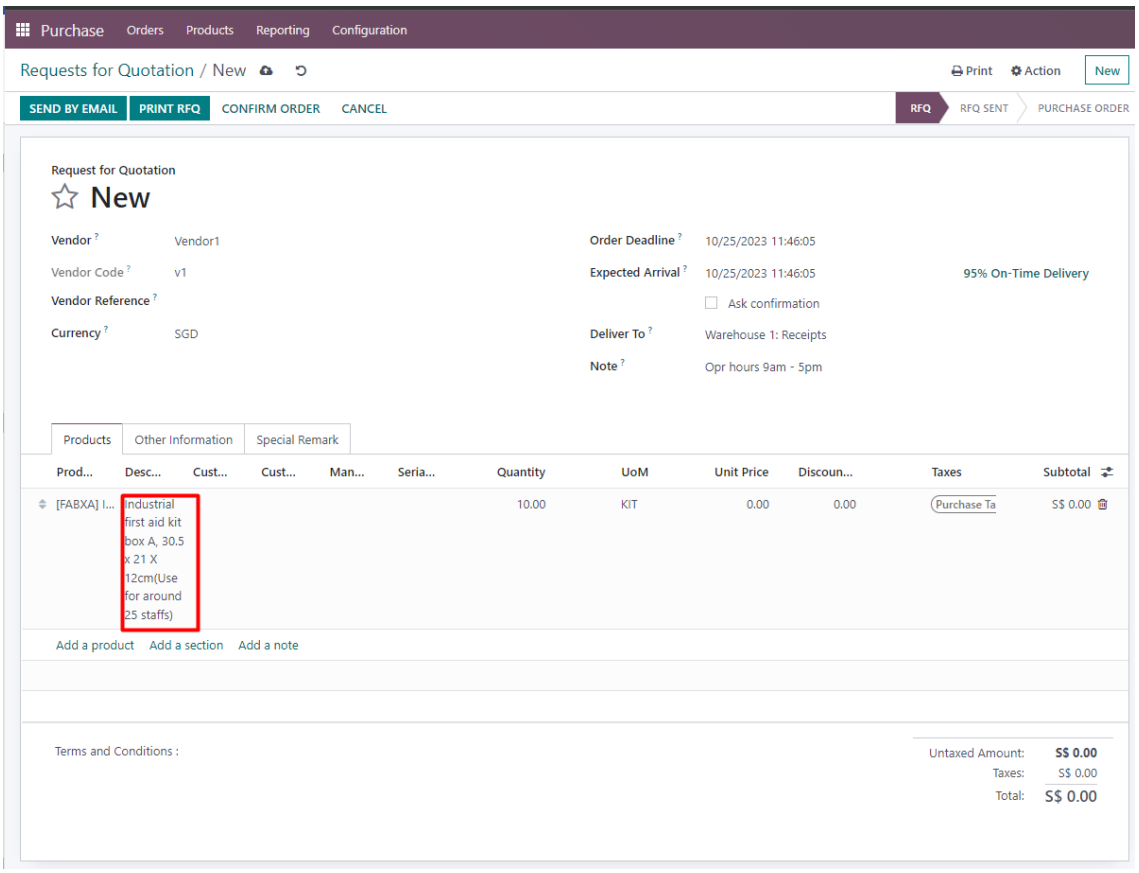


Go to the purchase module and make a PO for that product

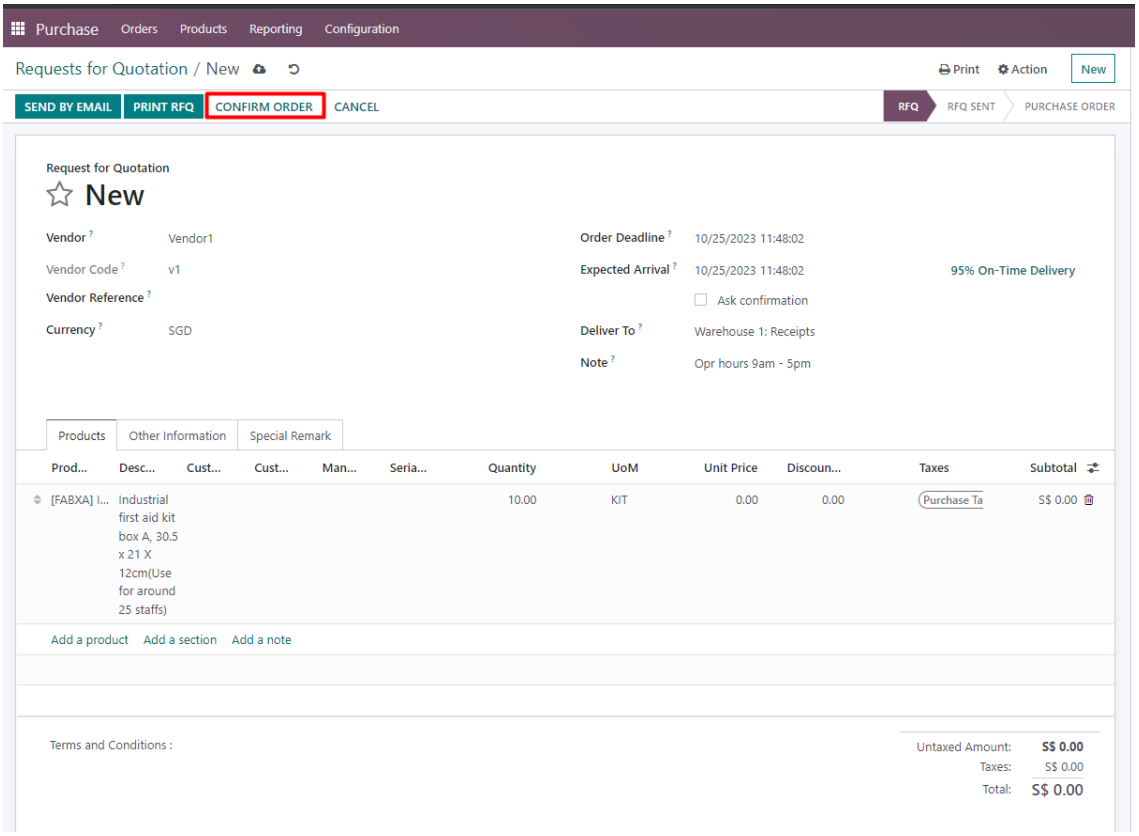
Click on create button to create a new quotation

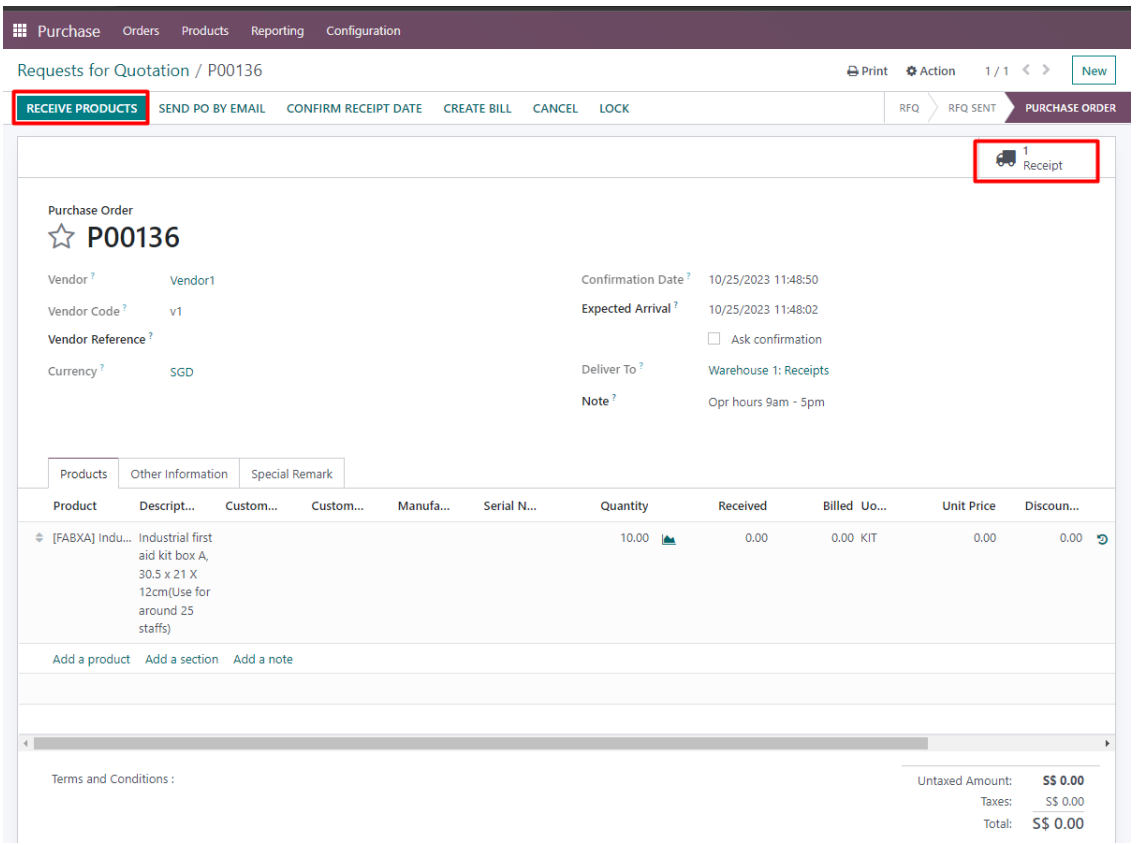


Add the product in the order line

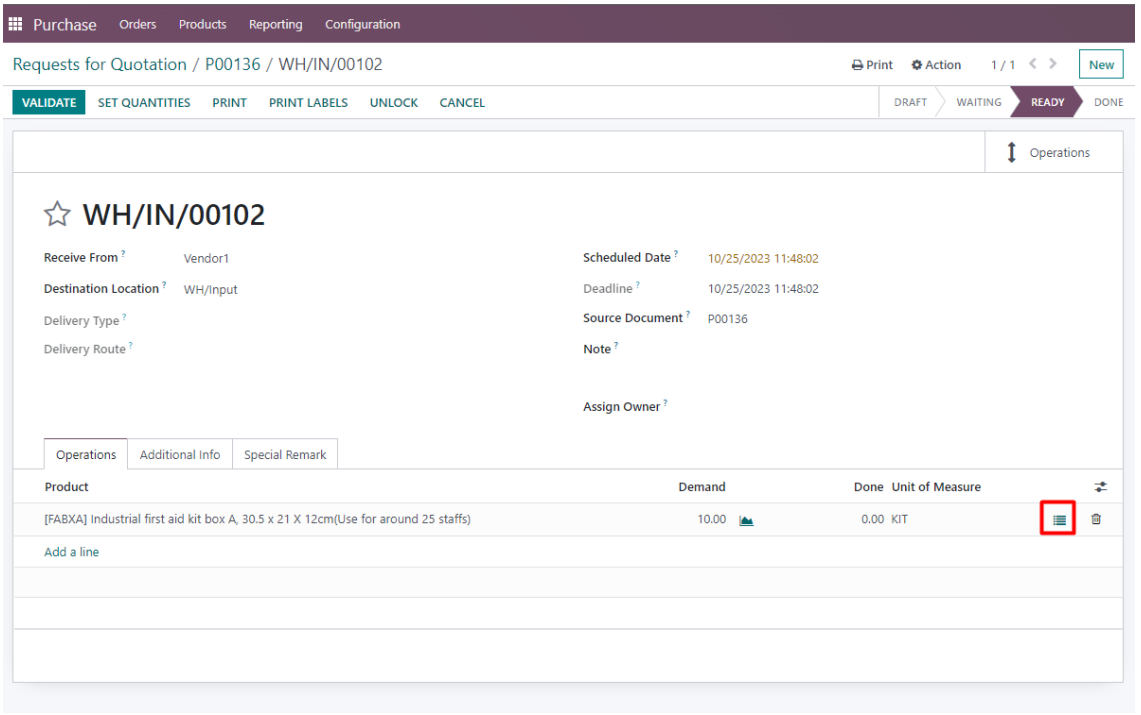


Confirm the PO, and click on received product or receipt

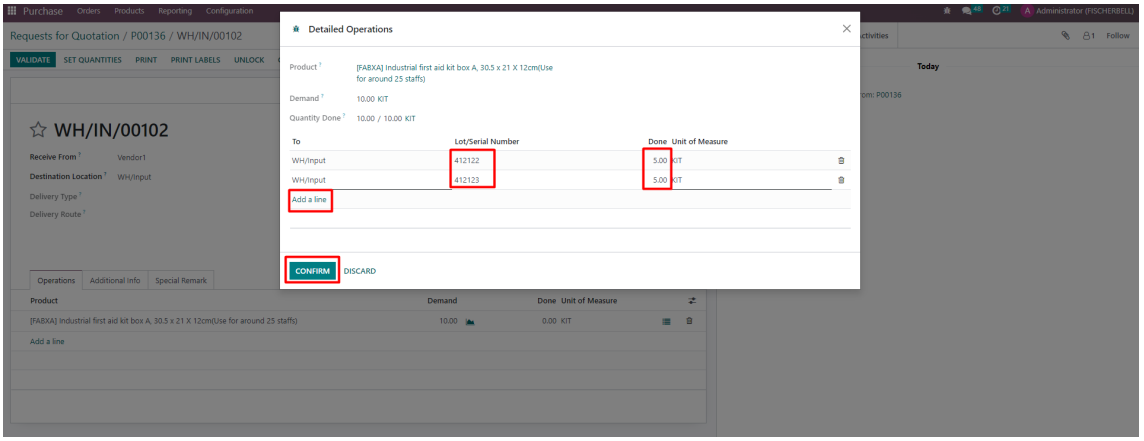




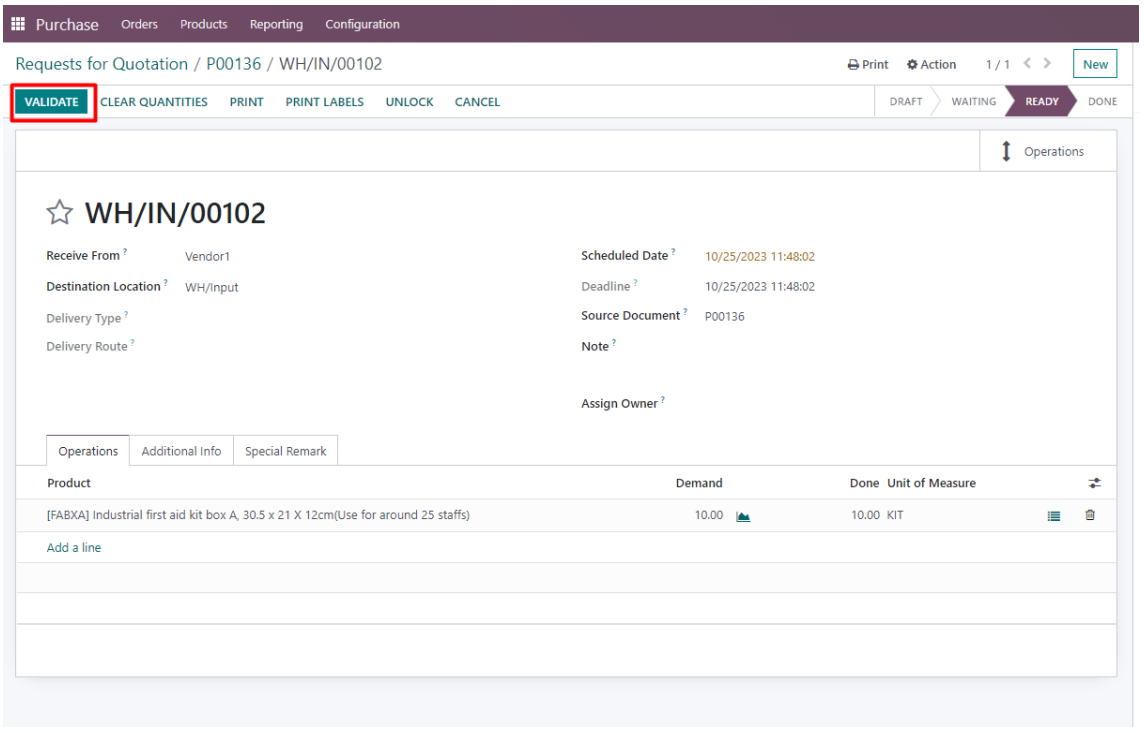
In receipt, click on this icon



And assign your batch number, through key in, by clicking on add a line and key in the batch number details

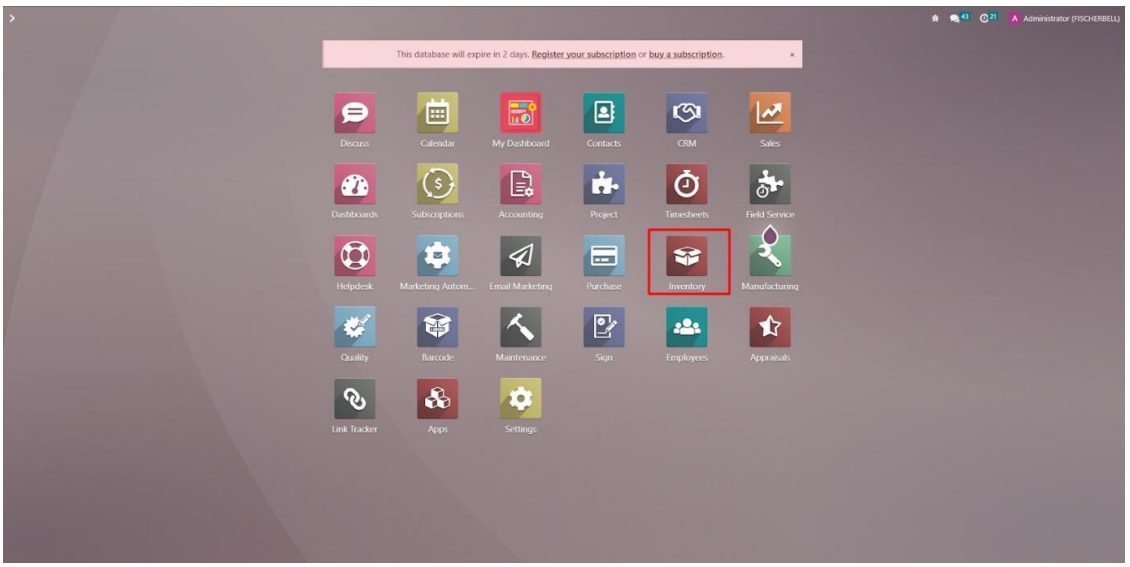


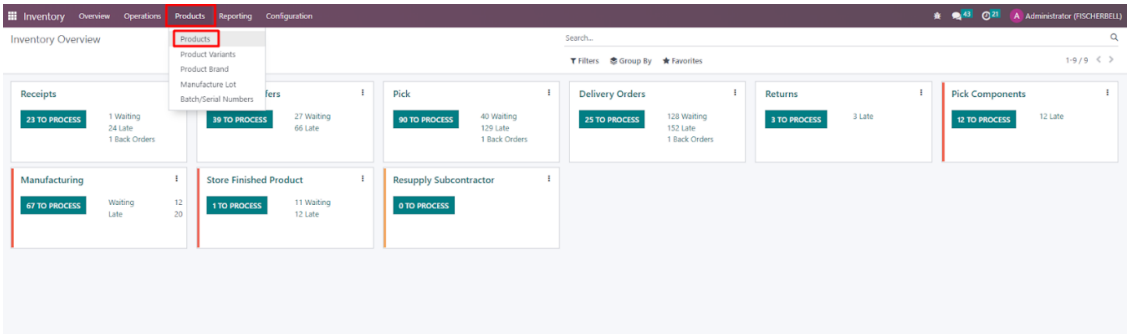
Click on confirm and validate the receipt



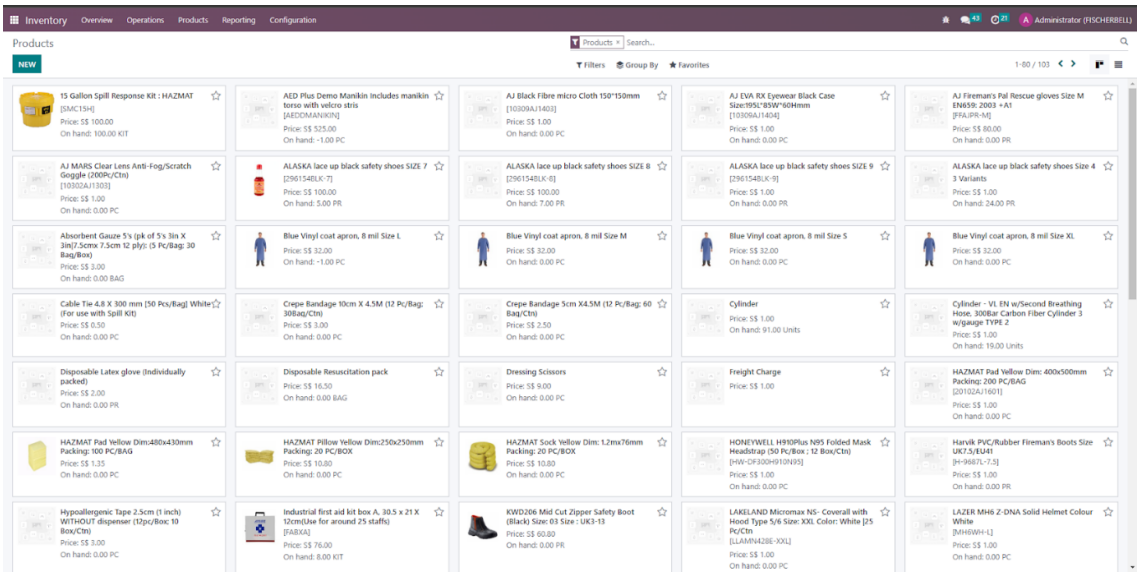
5.20. assign customer SKU per product

Go to the inventory module > product > product

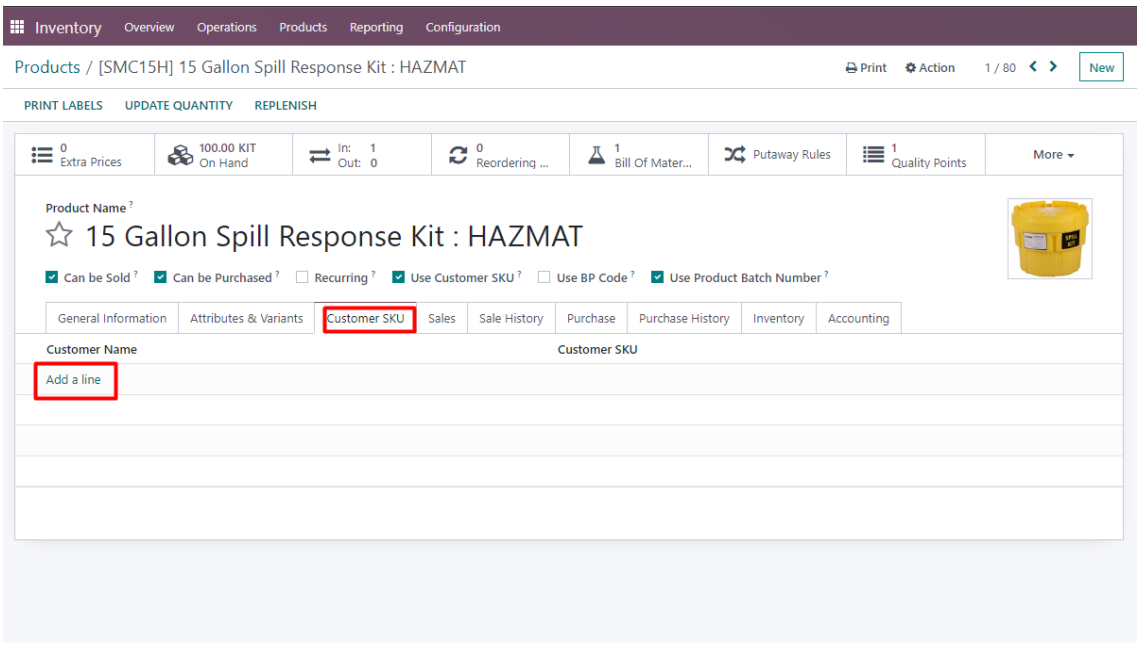




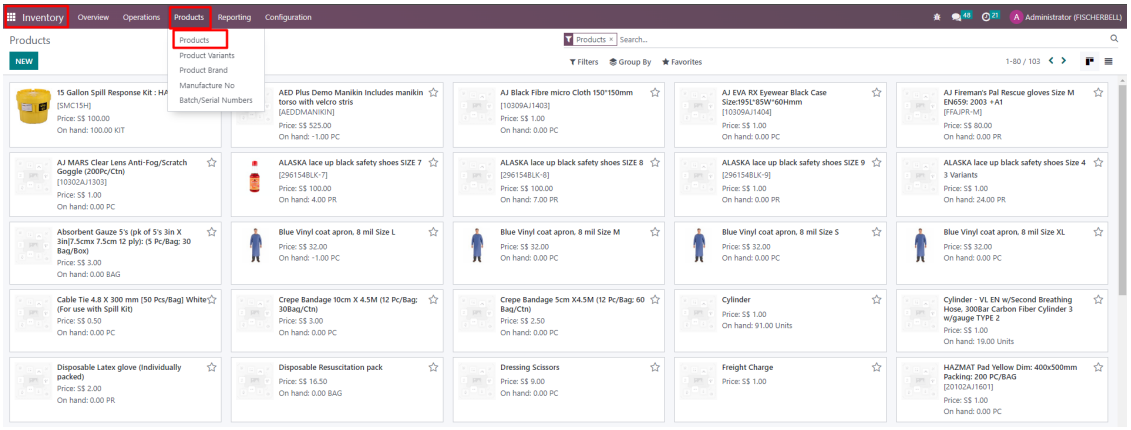
In here pick the product that you want to assign a customer SKU to, customer SKU can be more than 1.



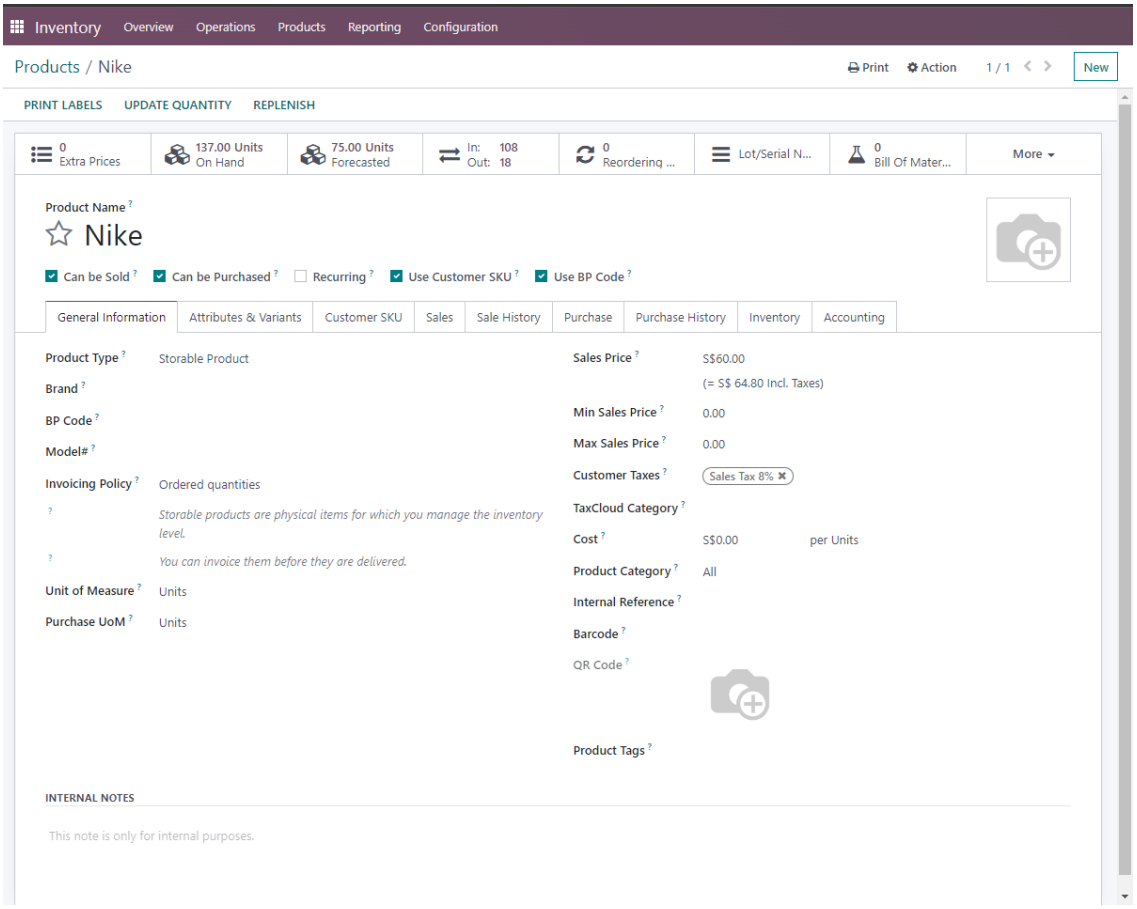
In the product go to the customer SKU tab and assign a contact and their customer SKU for that product



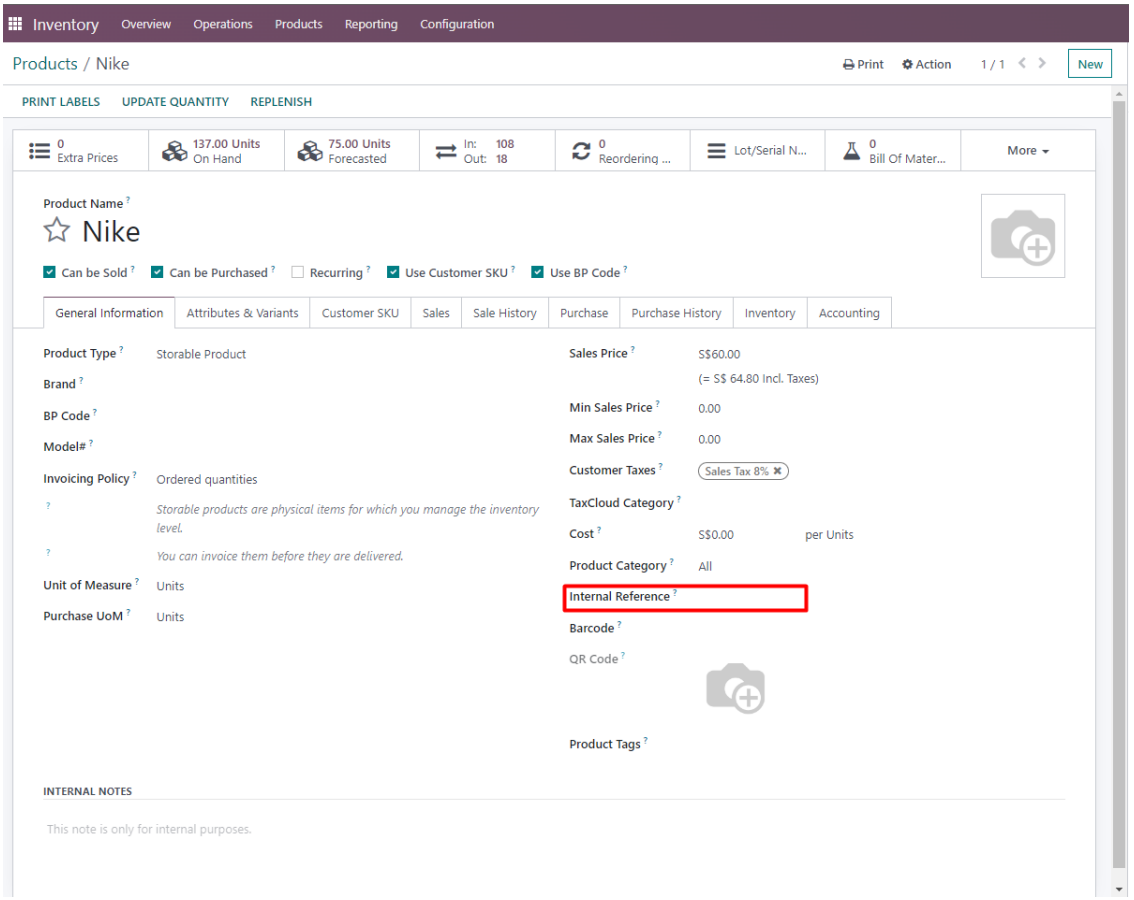
5.21. Assign Product code
Go to inventory > product > product



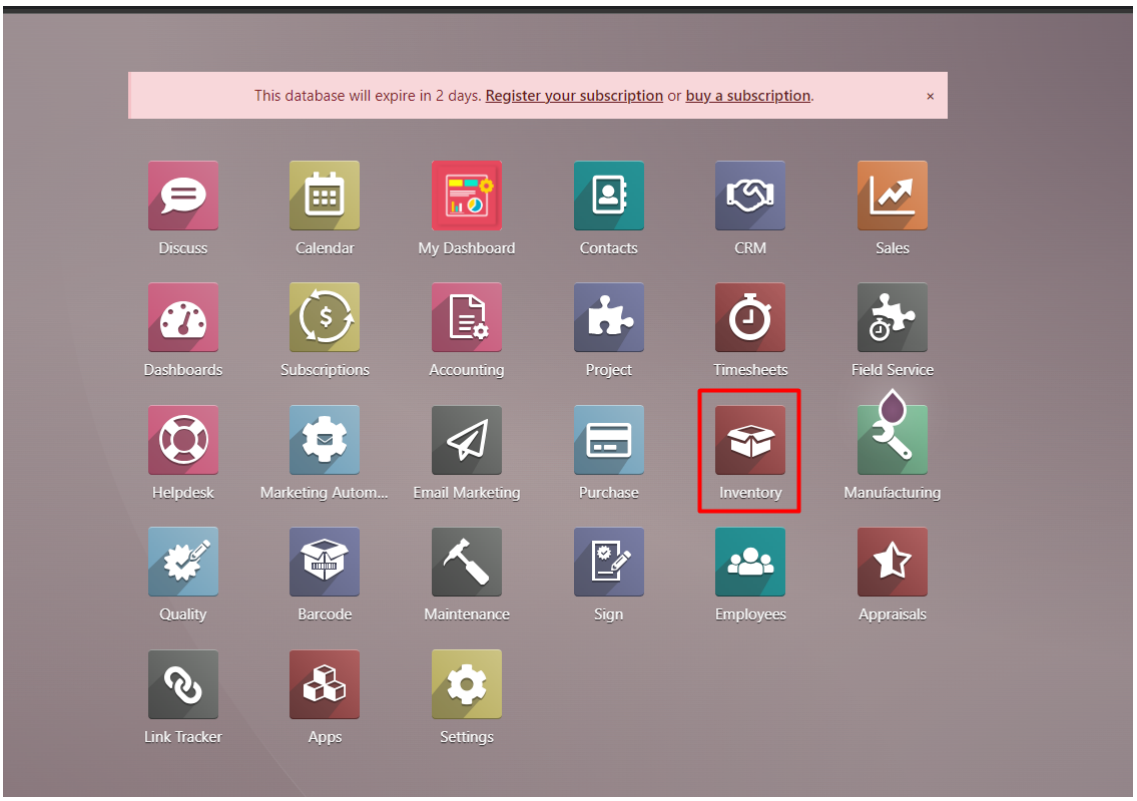
Choose the product that you want to assign a product code to

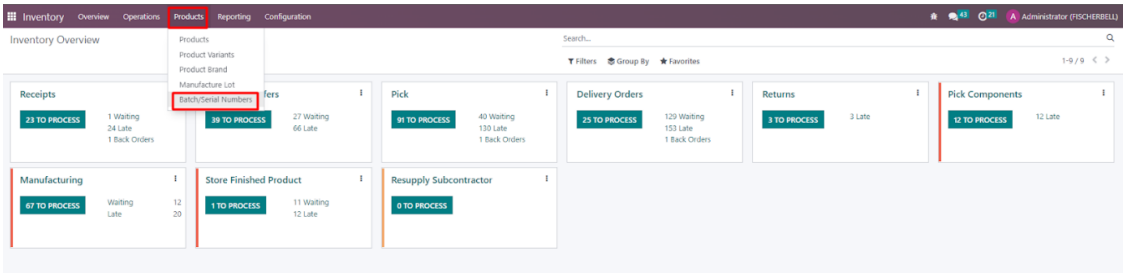


In general and information tab we have the internal reference field which will act as our product code

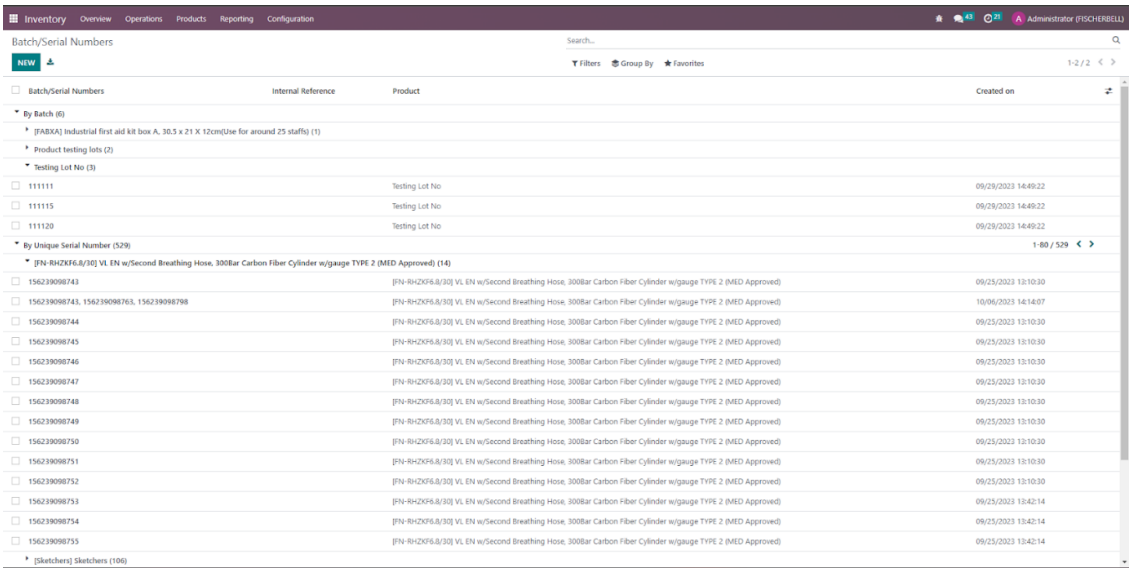


5.22. Track product number, batch number, serial number in product master
Go to the inventory module > product > batch / serial number



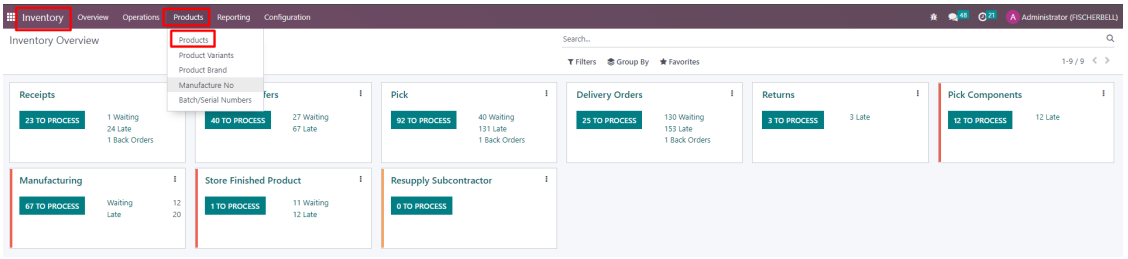


In here we can keep track of the batch number and Serial number

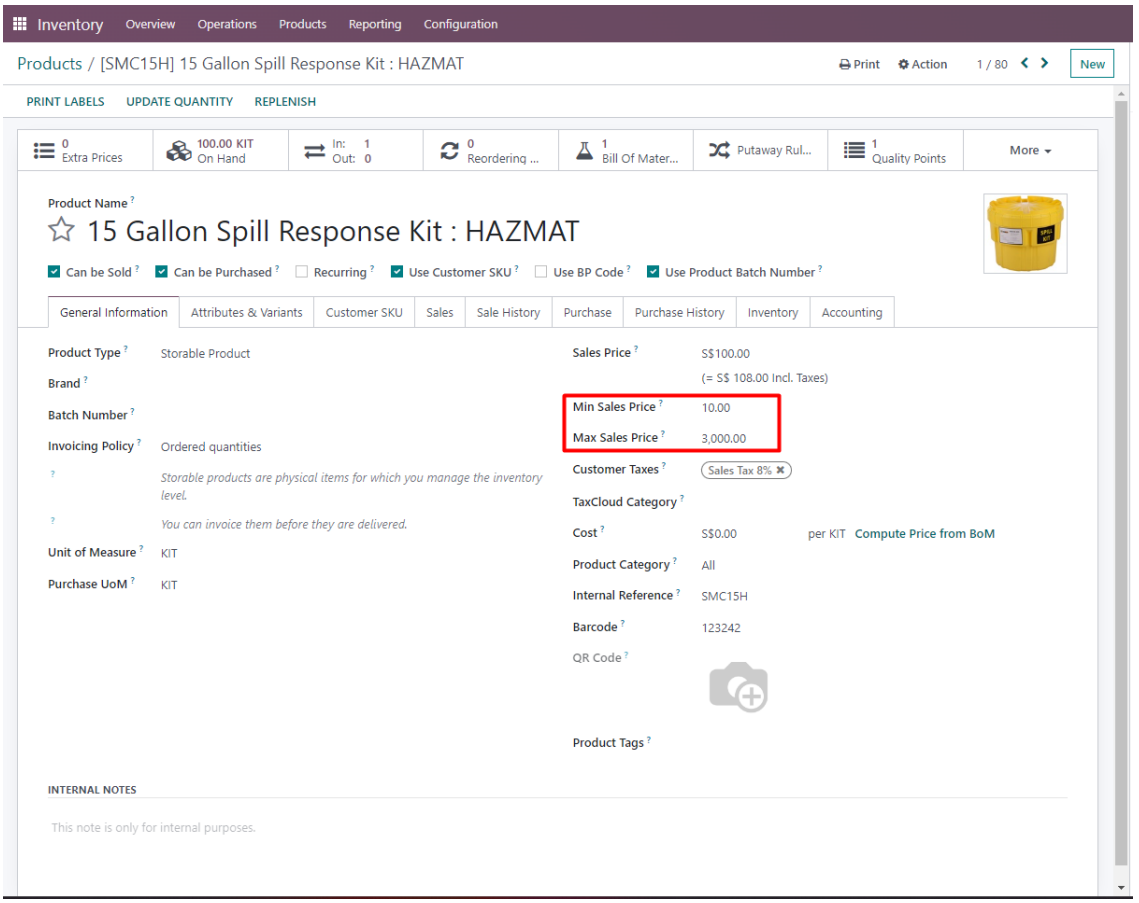


5.23. set price range for sales team to follow

In inventory > Product > Product



Choose the product that you want and in the general information tab, key in the min and max sales price of that product



5.24. "To print DO" filter must show SO that schedule activity is not done and done

In Inventory > Delivery order, you can choose the filter to show orders that is printed and not printed, that will also show the status of the DO

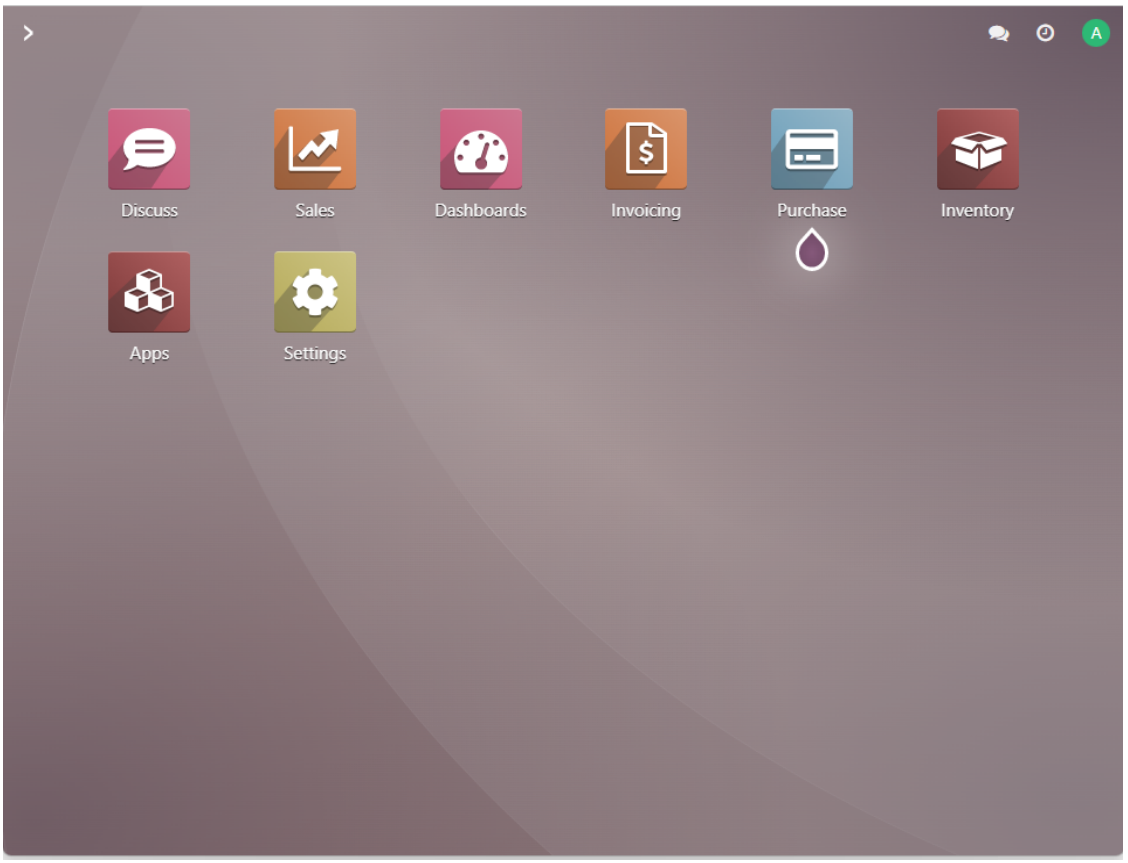
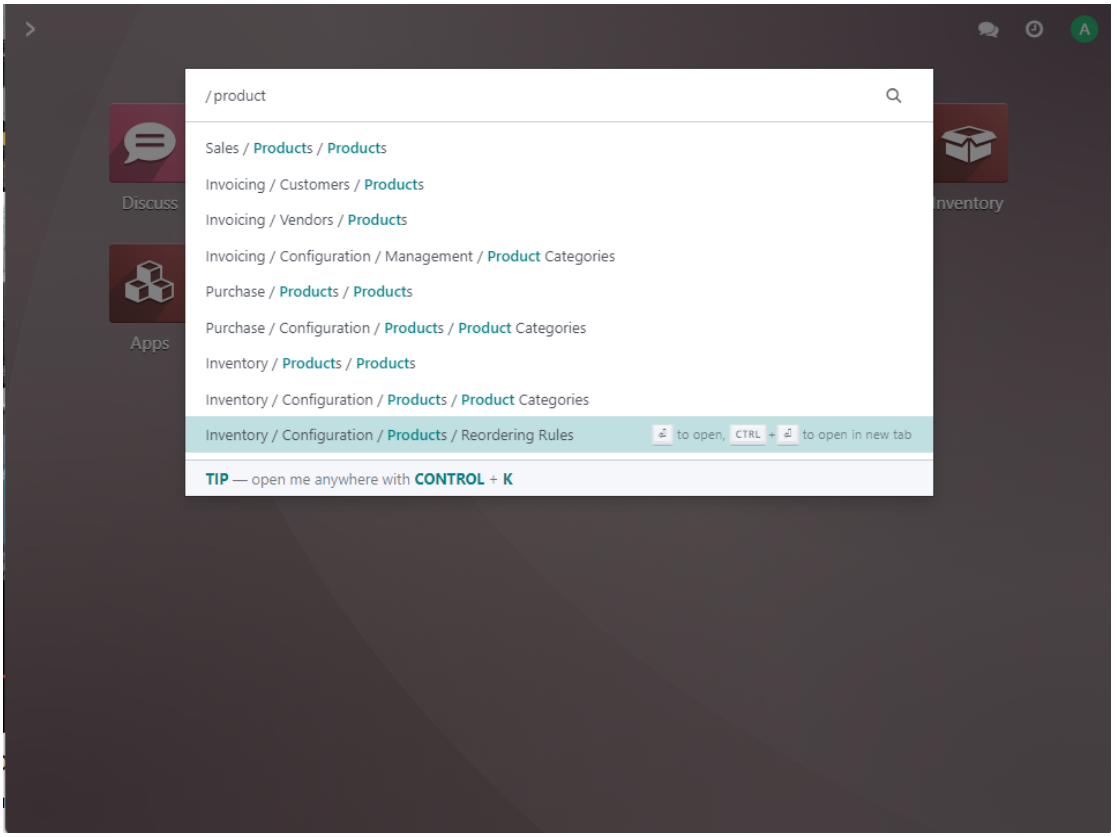
6. Sales

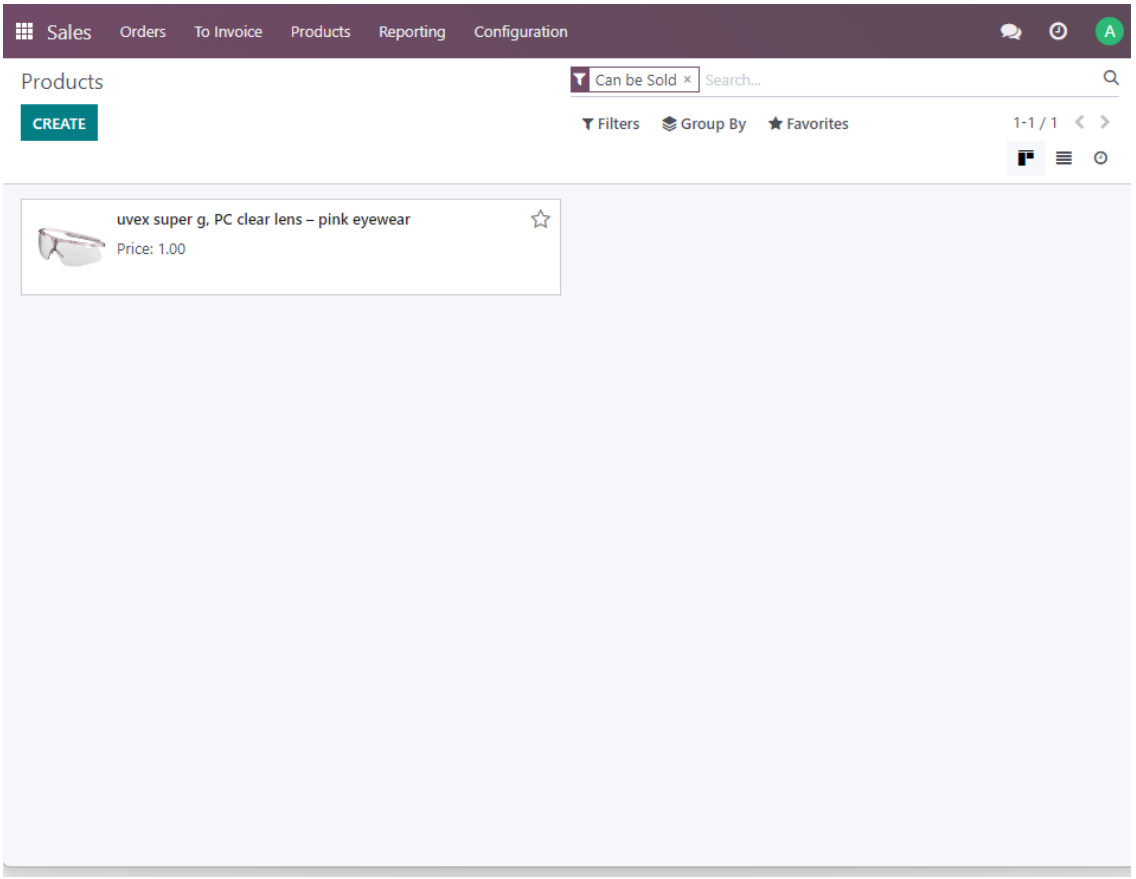
6.1. Creating Draft Product



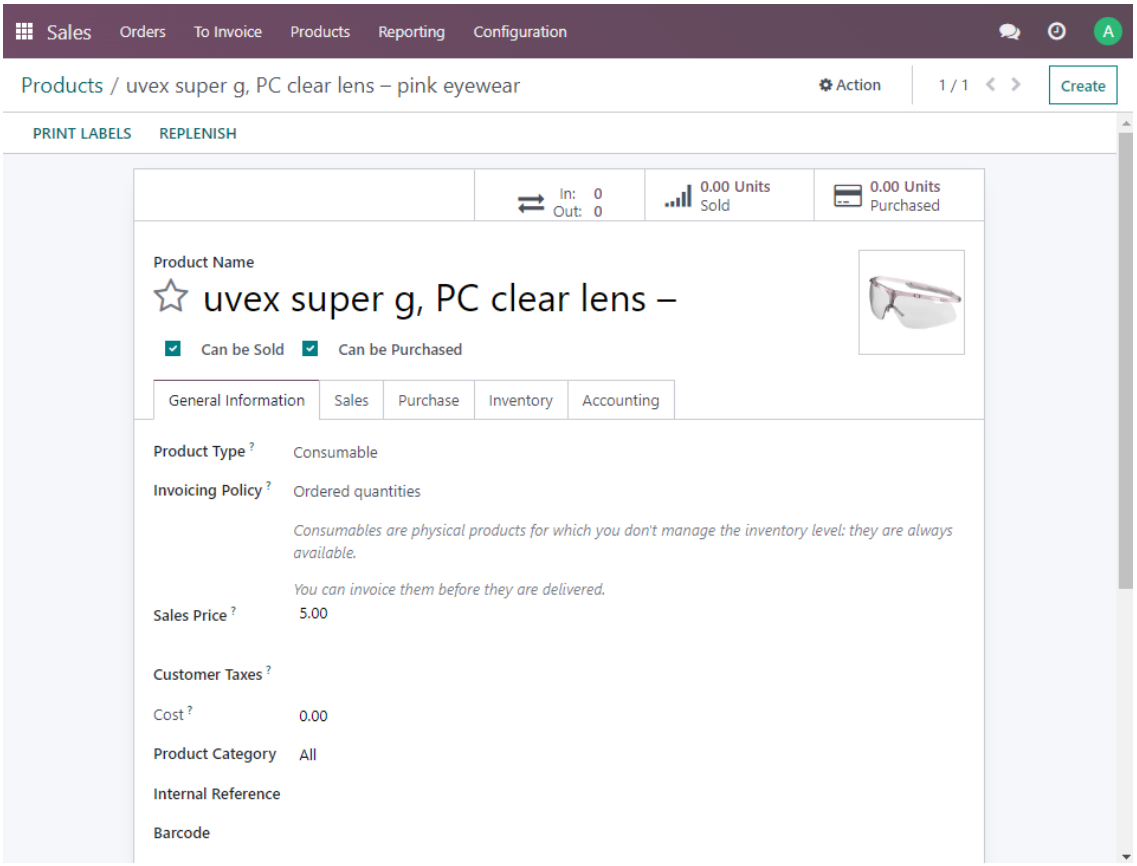
You can Create draft product by going to the Main Dashboard.



Then type “**Product**” then the system will show you a list, you select one of the lists above



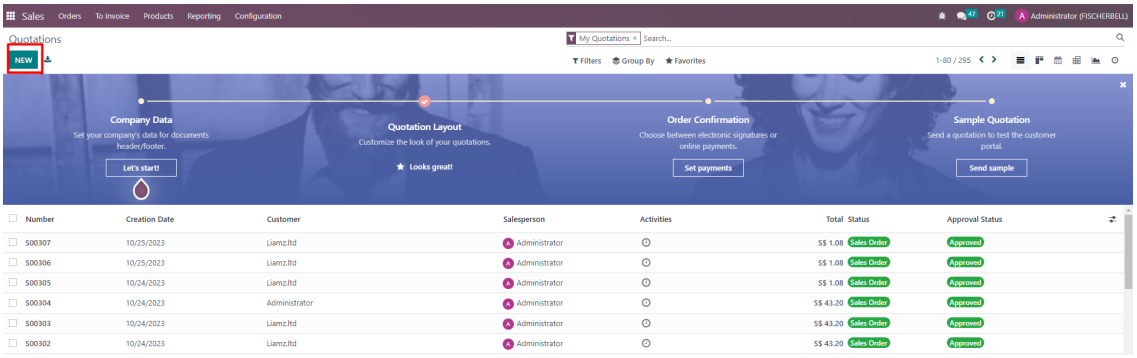
For create a new product Click the "Create” Button,



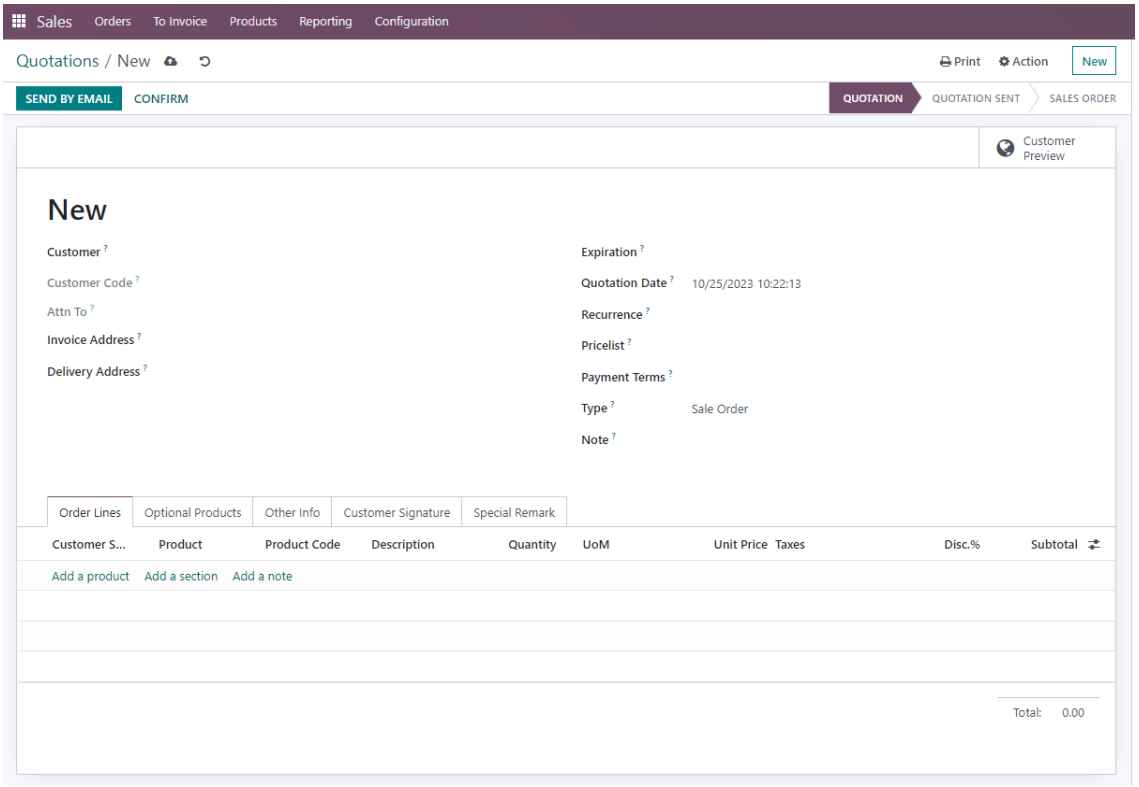
Then Fill necessary Info and Product Category, and click Save

6.2. Creating Quotation

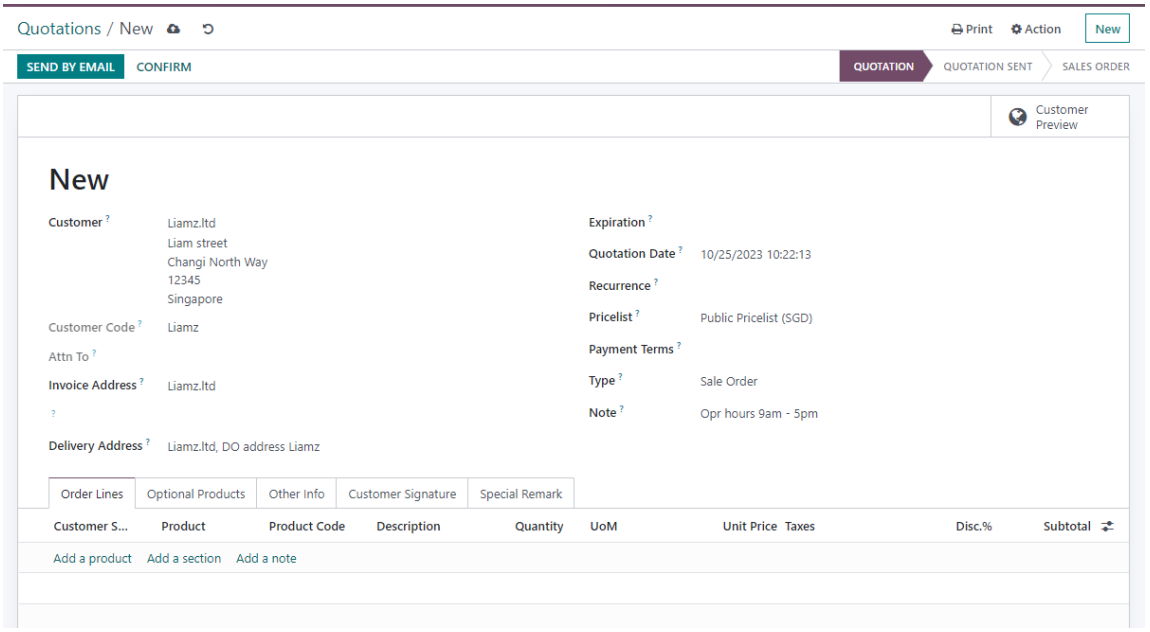
Go to the Main Dashboard, then can click on the "**Sales**" Module Icon



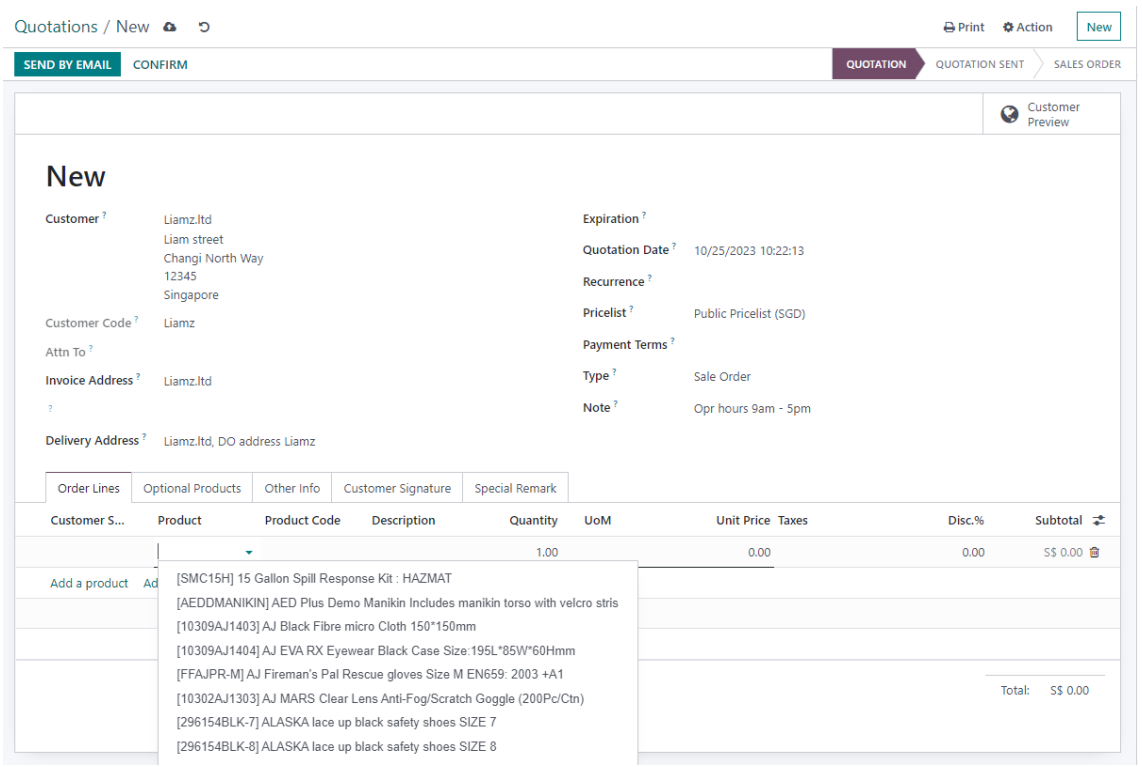
Then from here Click the "**Create**" Button on Top Left



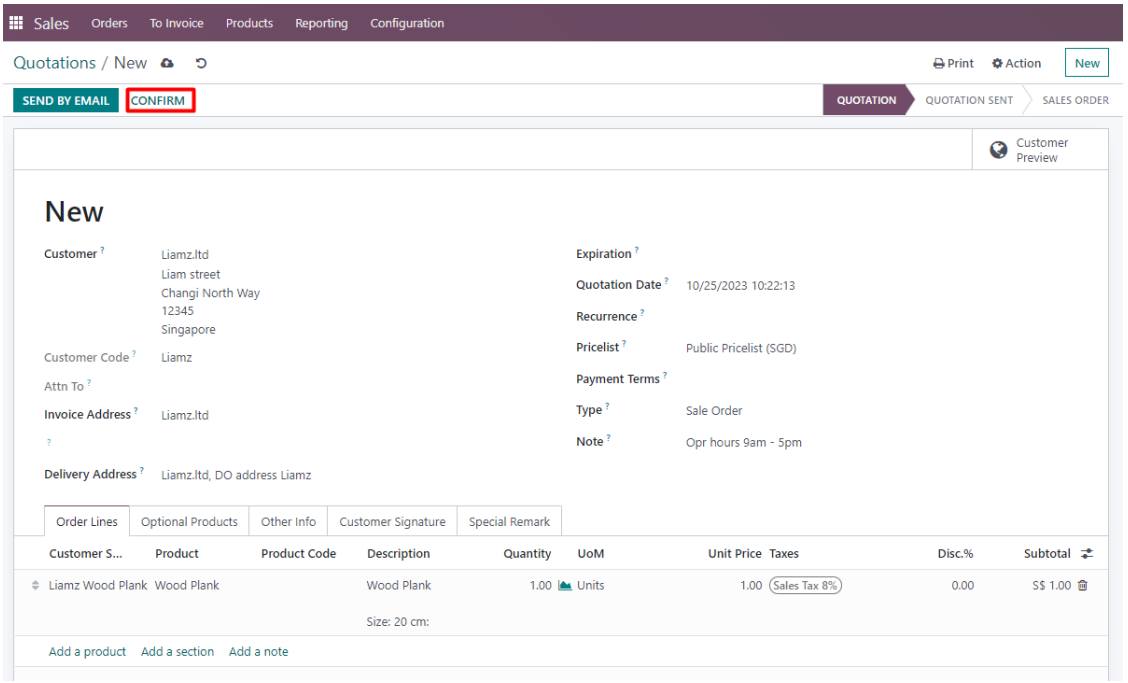
On the Sales Form you can set the Customer, and also other details that include on the Tab Other Details



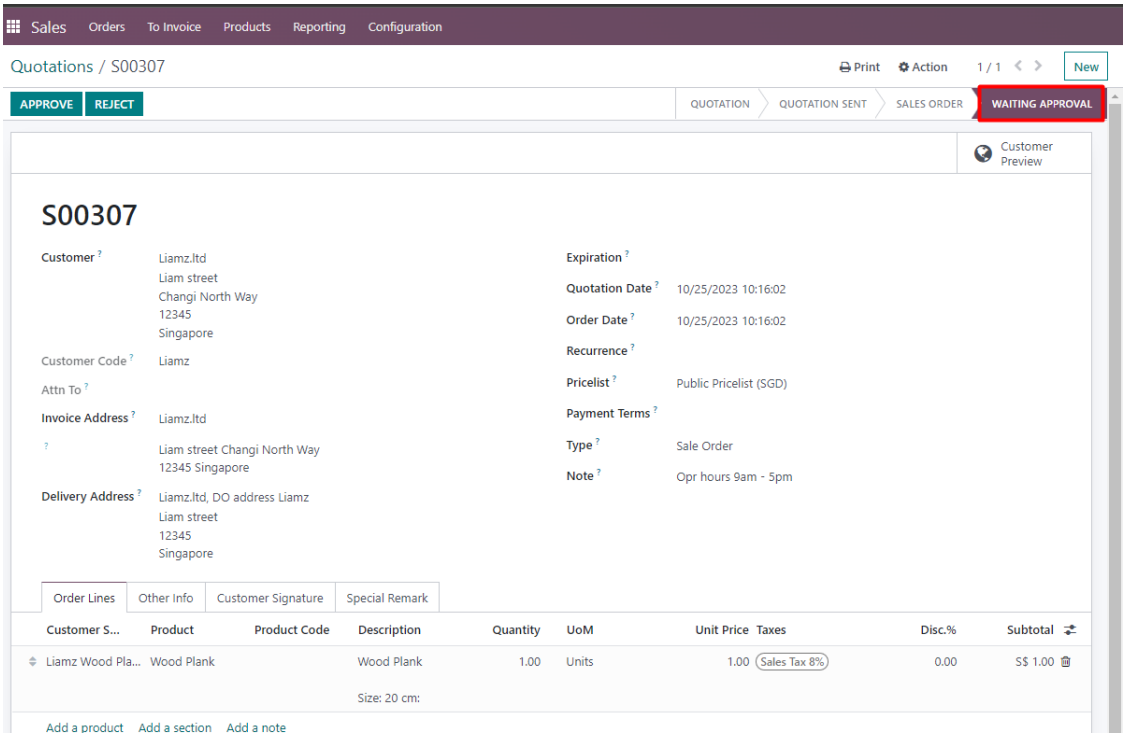
To select Products the Customer will buy, we can click the Order Lines Tab and below can Click on the Add a Line text



6.3. Confirming Quotation

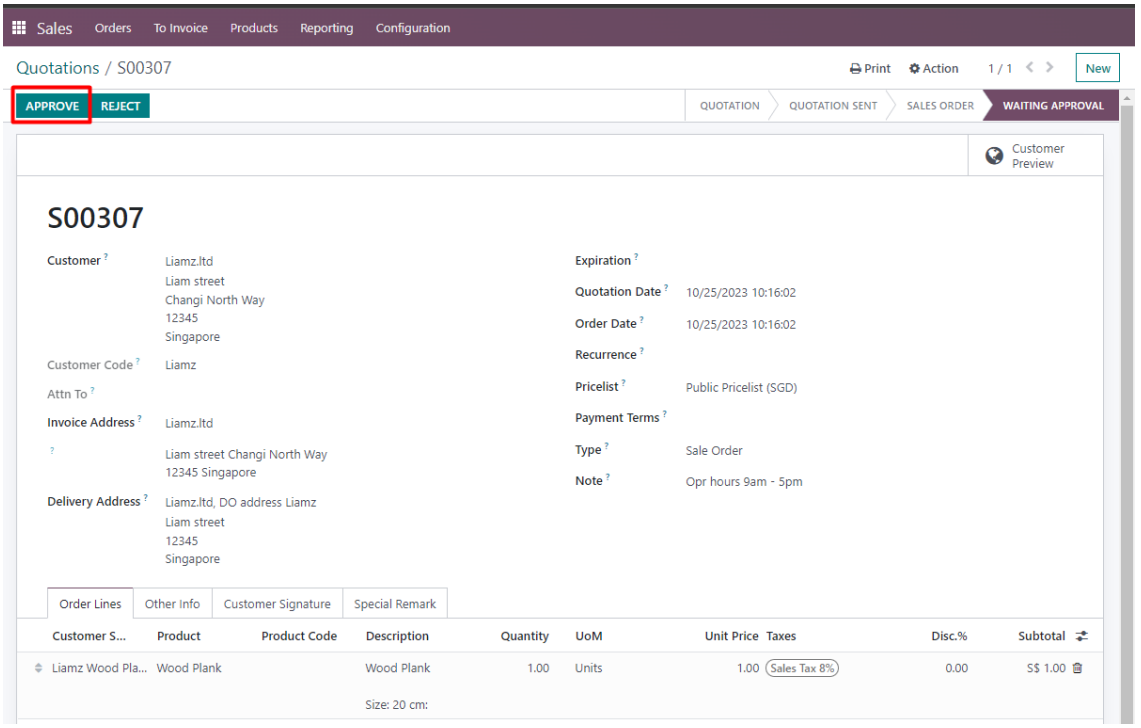


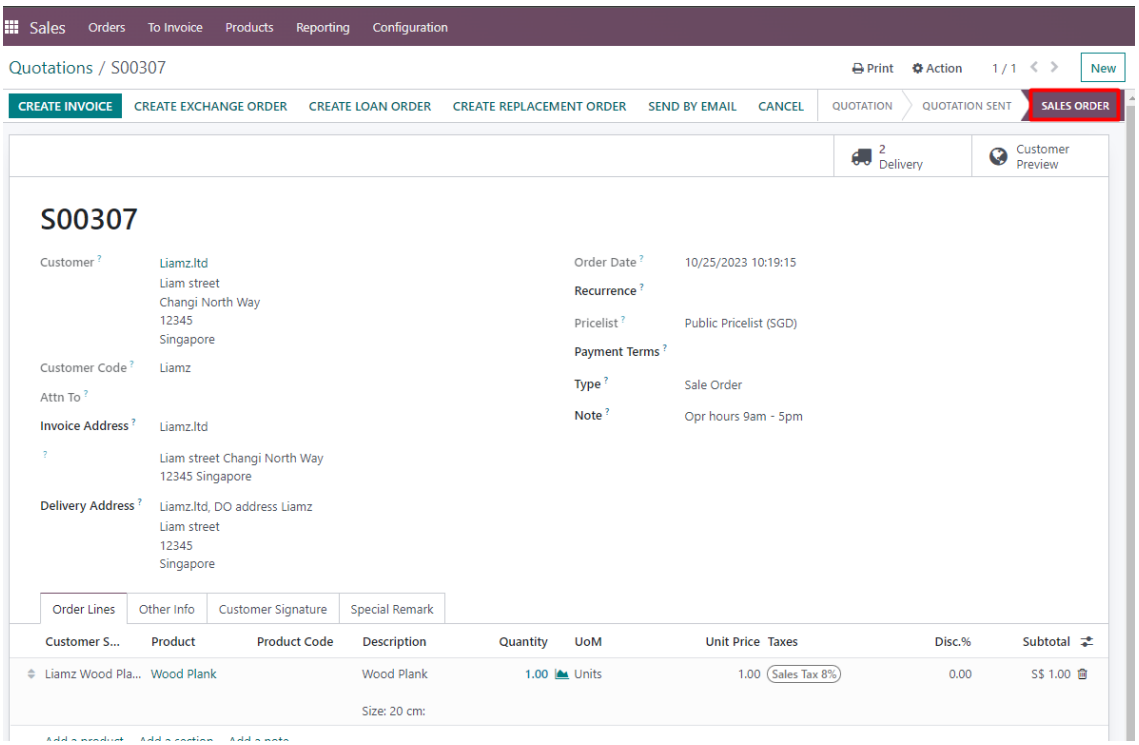
On the Sales order you want to Confirm, Click confirm button



You can see the status of that Quotation, is being changed from 'Quotation' > ‘waiting approval’

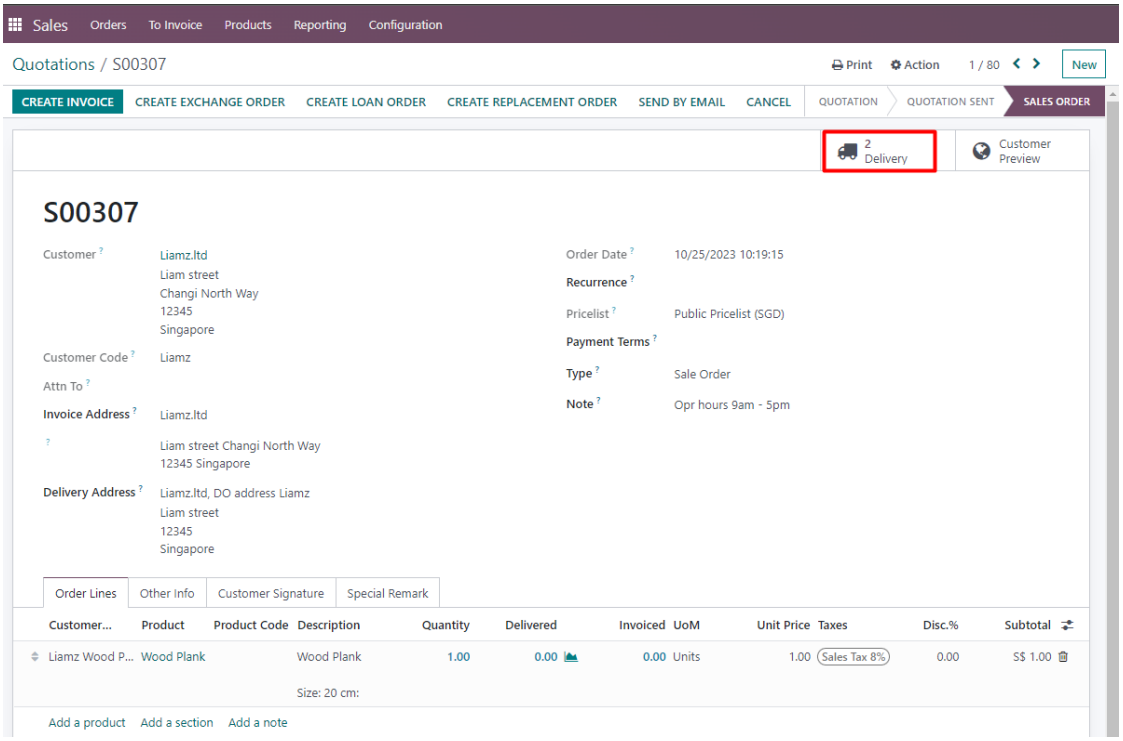
6.4. Confirming Sales Order



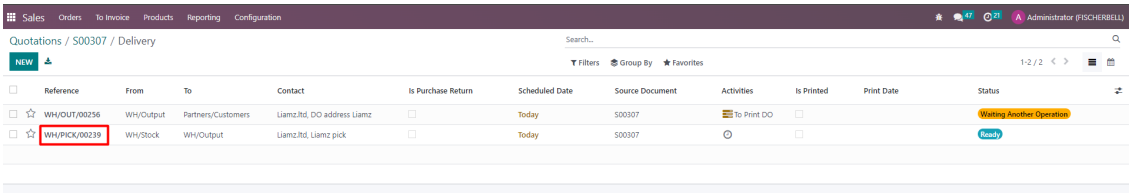


On the Sales order you want to Approve, Click approve button
Now you can see the status of that RFQ, is being changed from 'RFQ' > ‘Sales order’

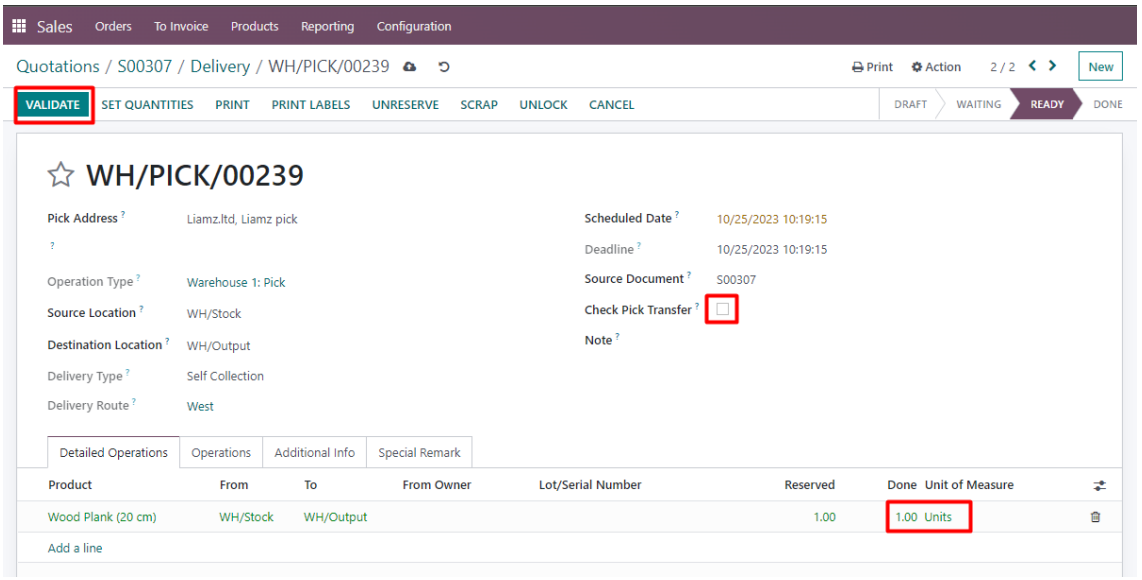
6.5. Process Picking Order



On the Sales order, click the Delivery button

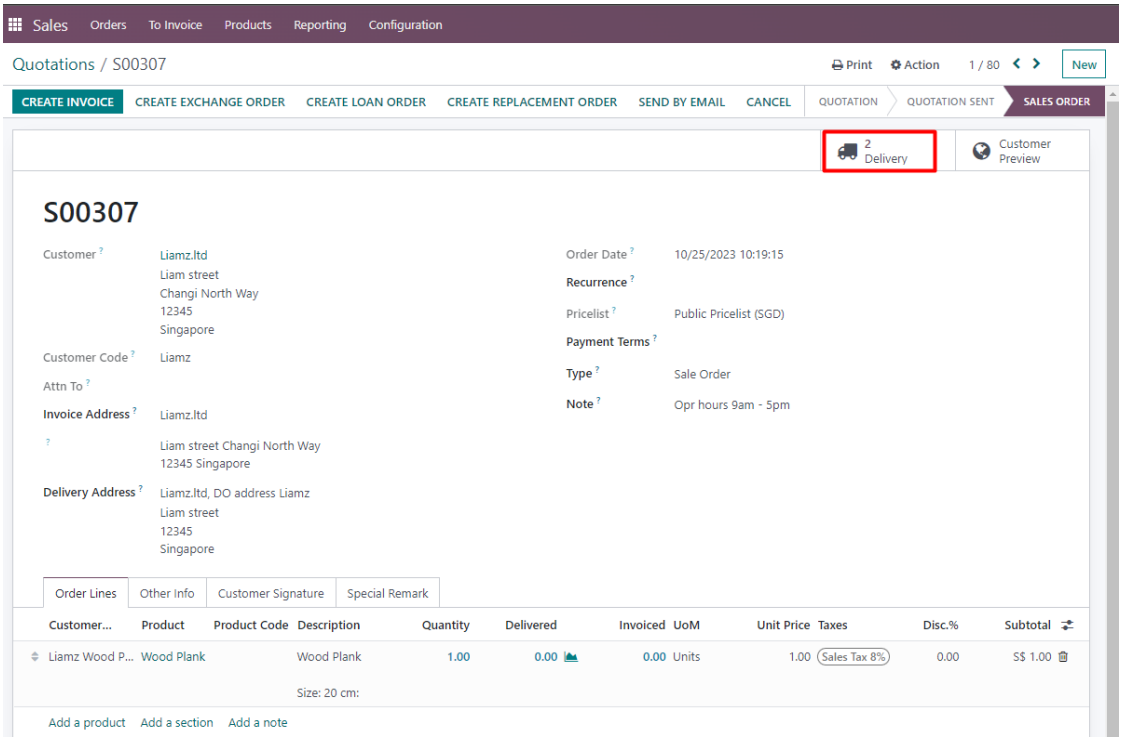


Select Record with PICK In References

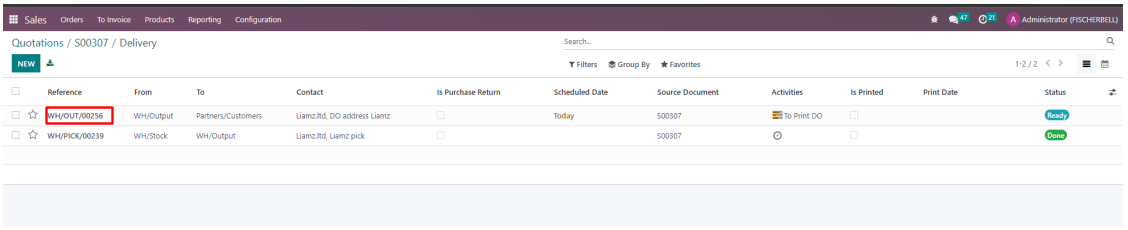


set the quantity after that, you can tick on the check pick transfer first and then the validate button

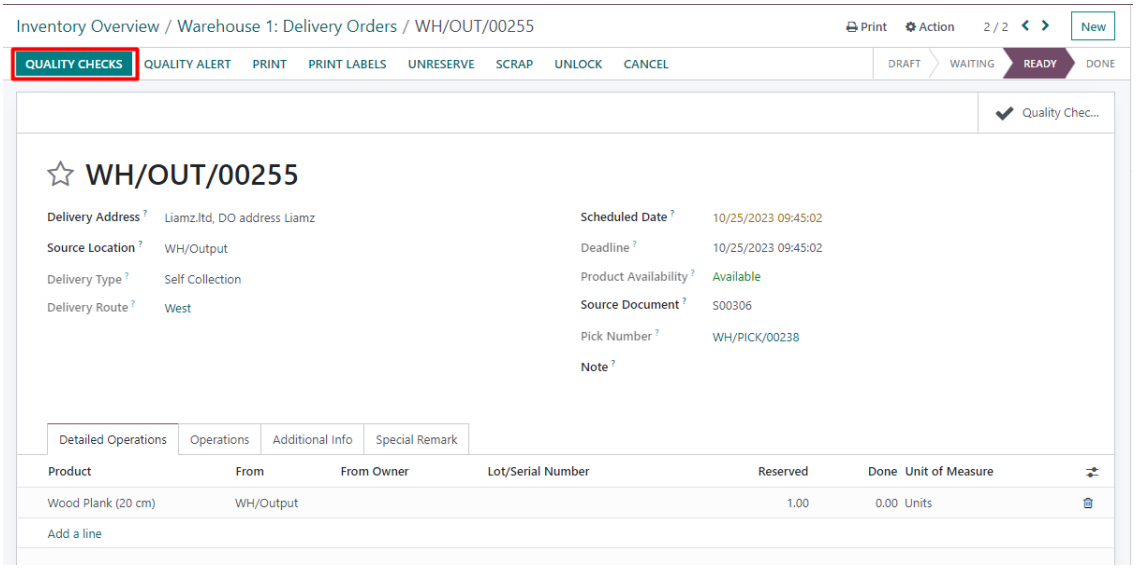
6.6. Delivery Order Process



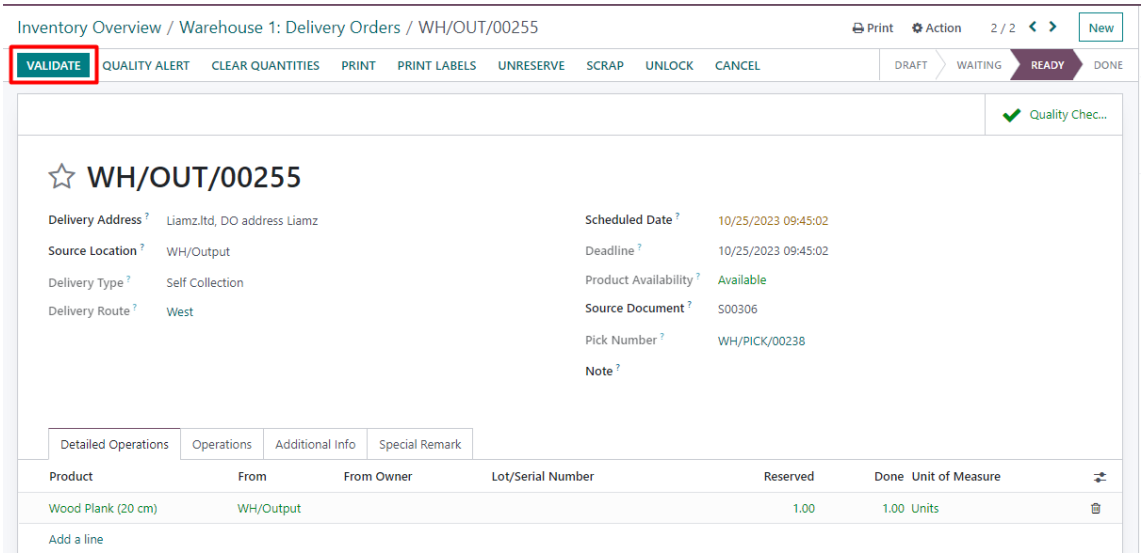
On the Sales order, click the Delivery button



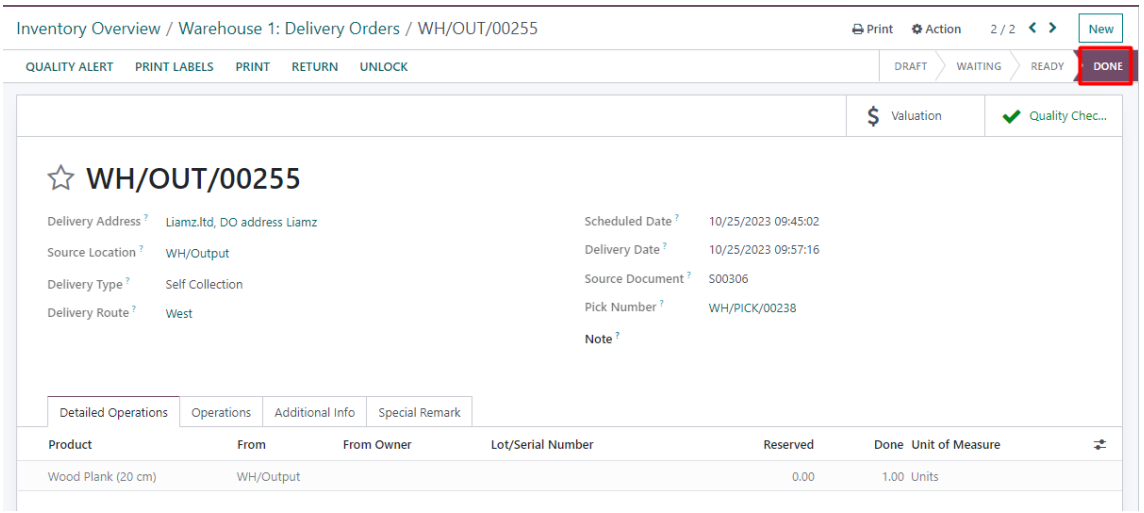
Select Record with OUT In References



wait for DO to get pass quality check/approved

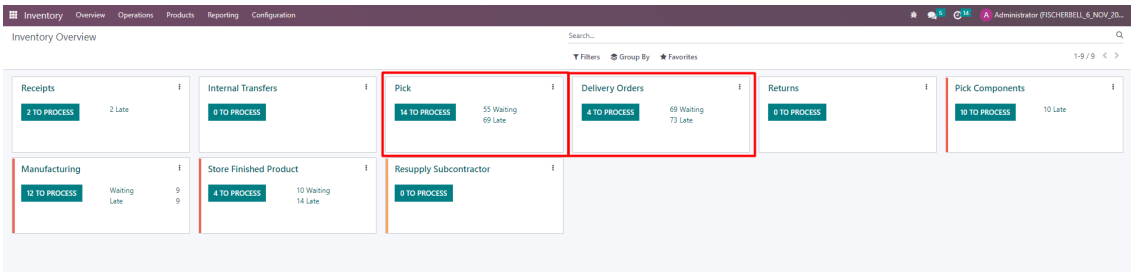


After the DO pass/approved, set the quantity delivered and signed by the customer and click on validate

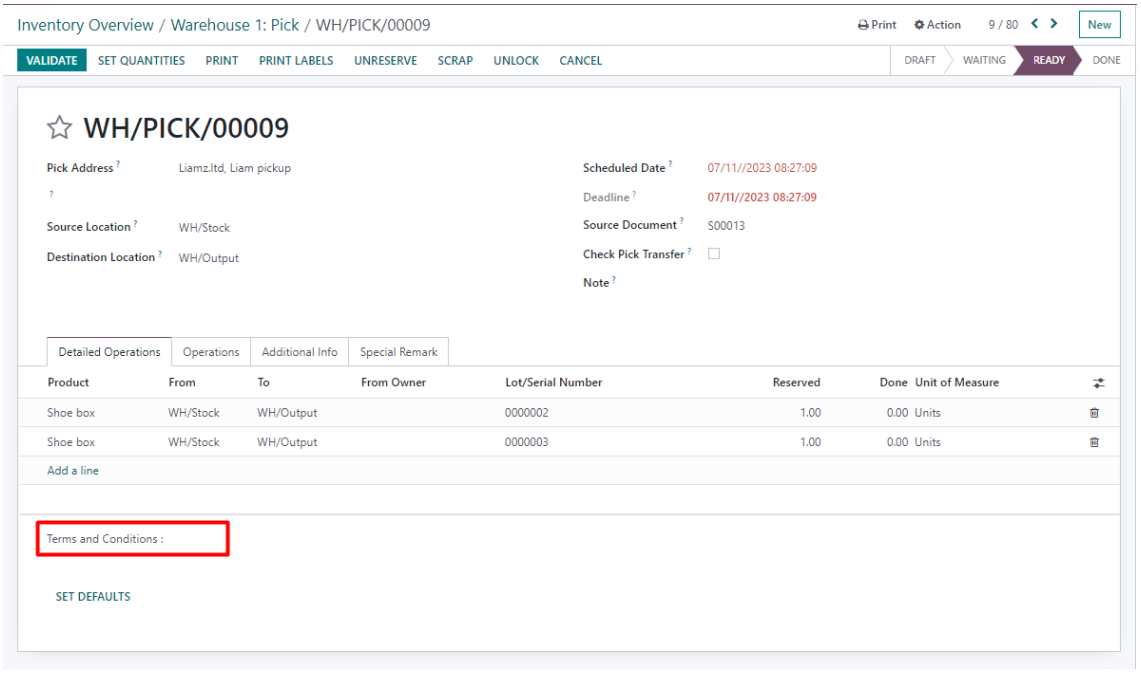


The state of delivery order will change from ready to become done.

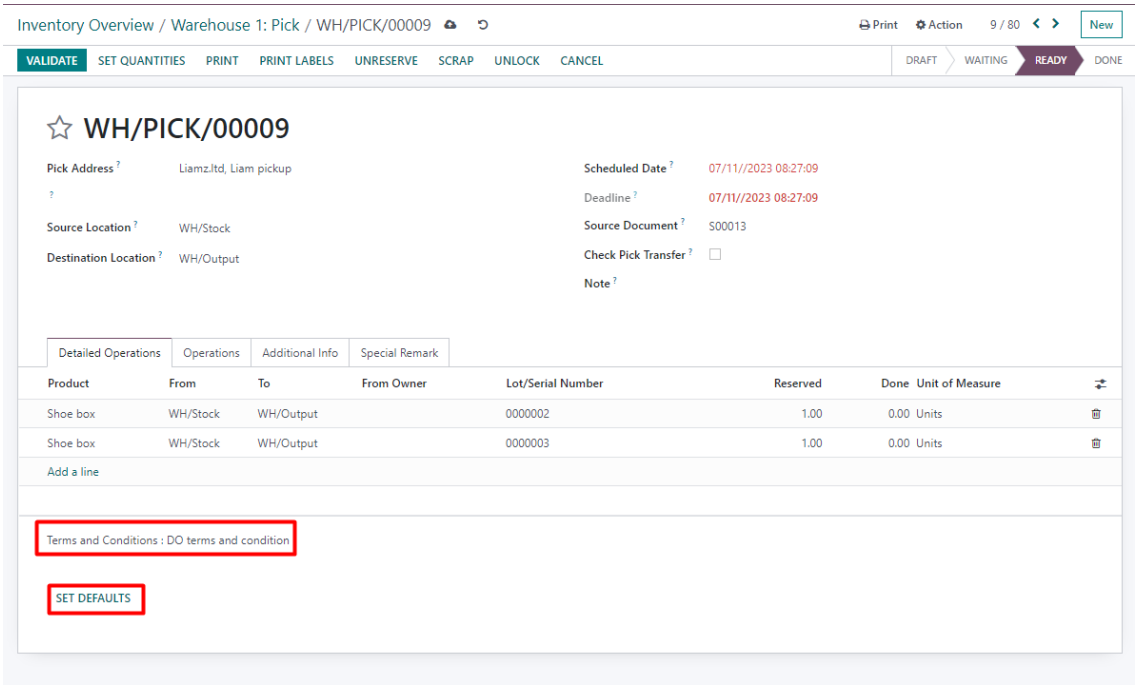
6.6.1. Terms and condition in DO
In the main dashboard go to the inventory module and choose a existing PICK or DO



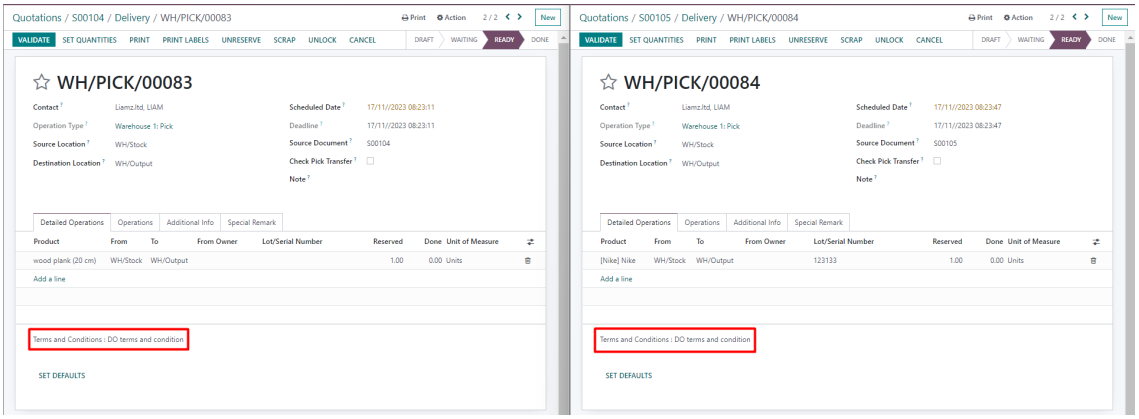
Under the order line we can see a field for terms and condition



Key in the terms and condition for the DO and click on the set it as default

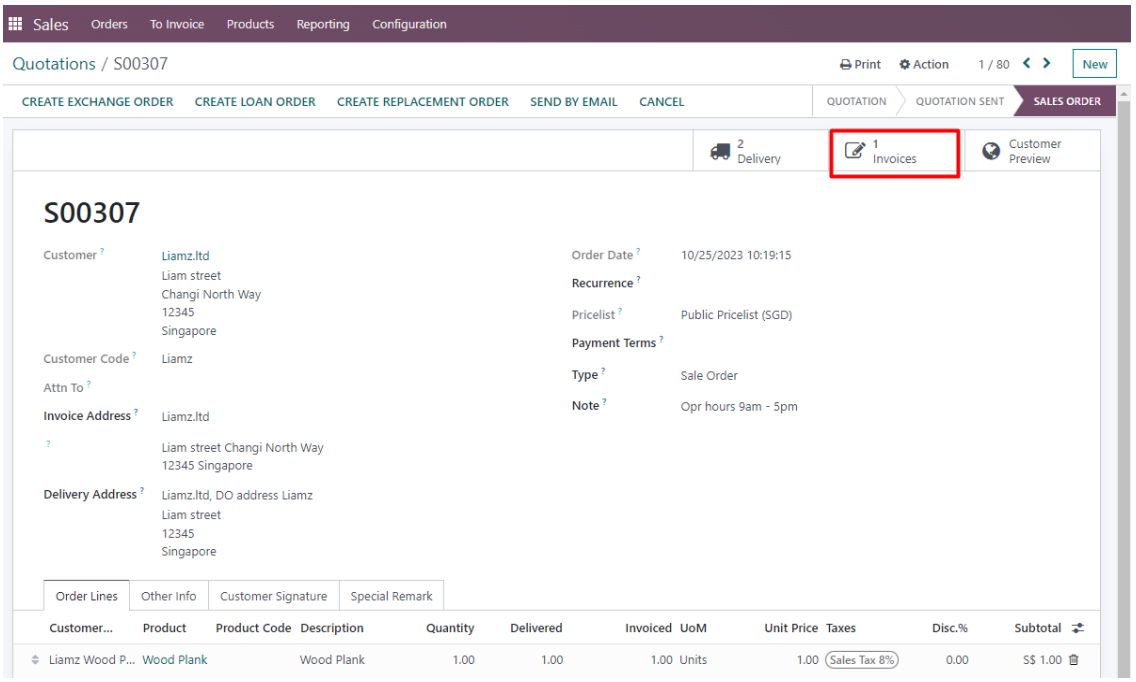


After you click on set as default the next DO and so on will be using that terms and condition



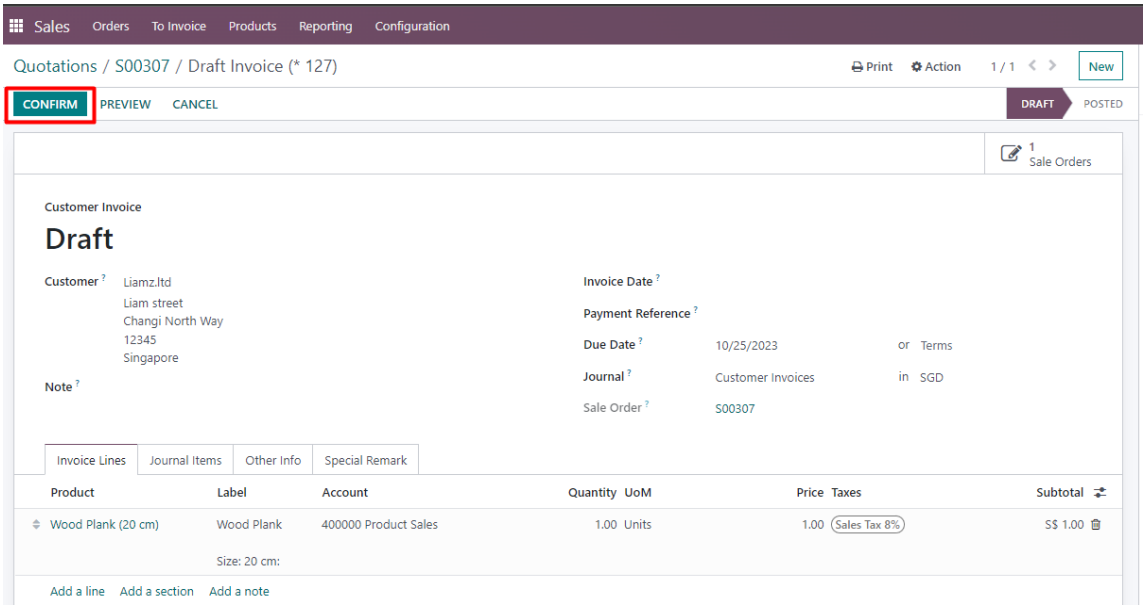
Note : if there is a special case where you will only use a terms and condition one time, you can key in the terms and condition and not click on the set as default button, it will not change the default terms and condition for DO and will also reflect in the printout

6.7. Create Invoice

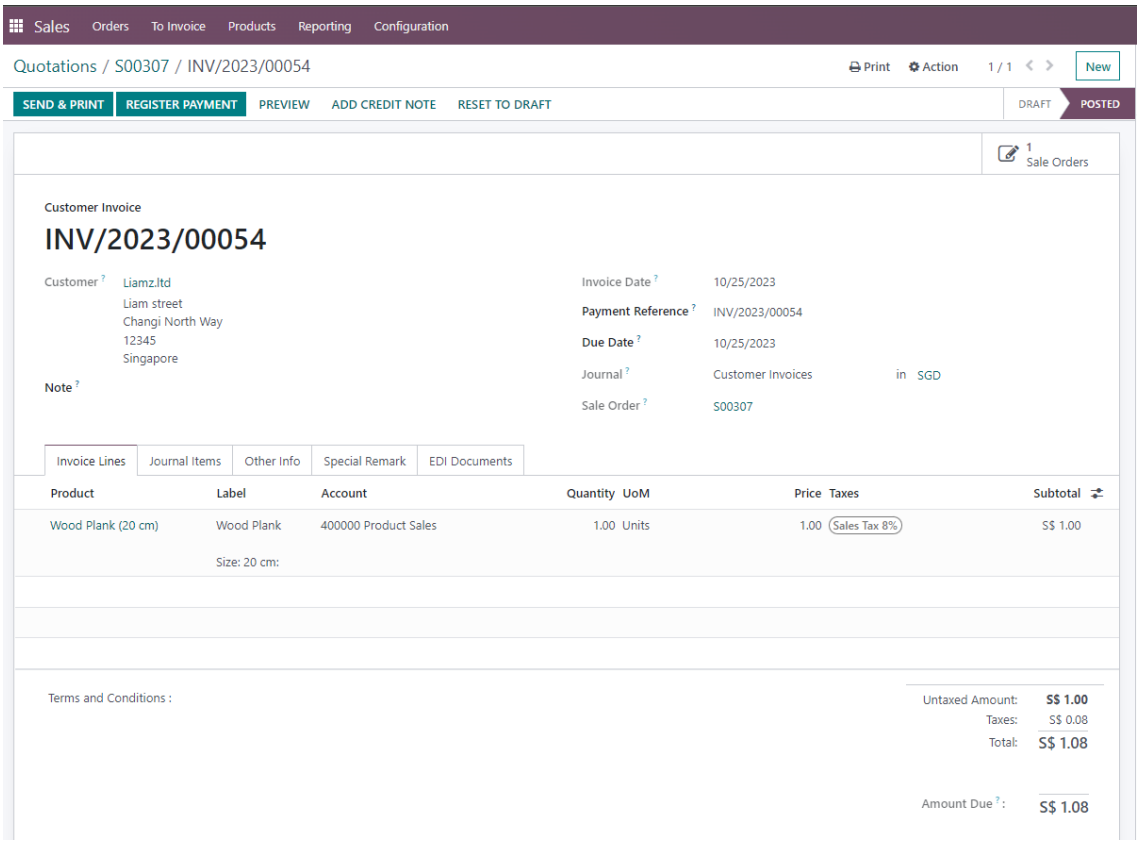


After you validate a delivery order in the sales module, the system would automatically create a draft invoice

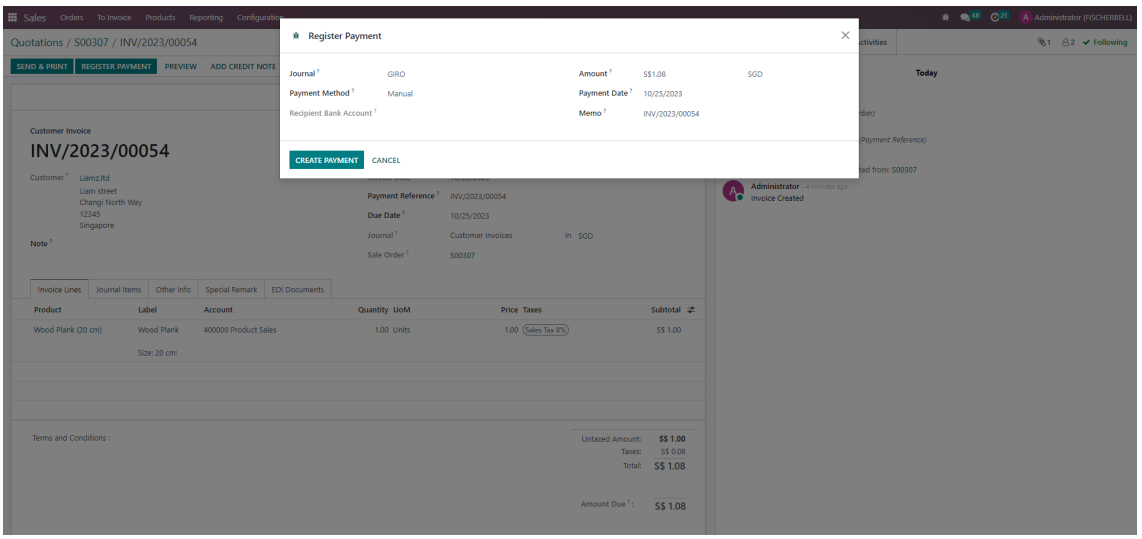
6.8. Create Payment



After the system created a invoice, confirm the invoice first



Then click Register Payment to add payment for the invoice

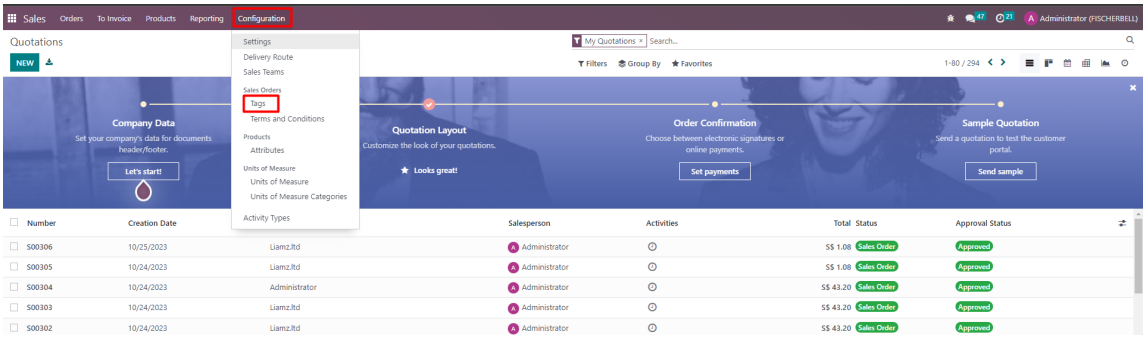


Input the method, reference, amount and date of the payment. Click "Create Payment" to pay the invoice

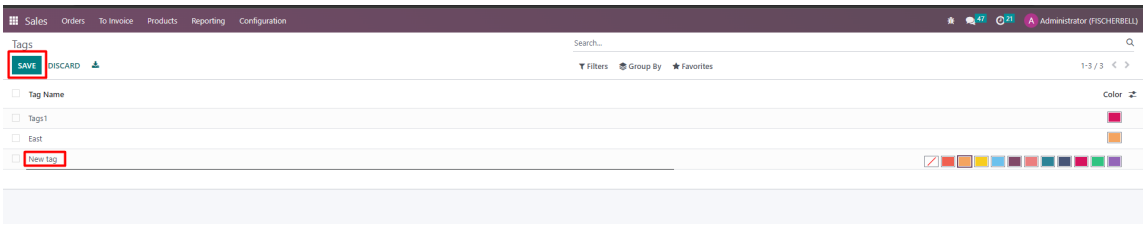
6.9. Creating and using tags

6.9.1. Creating a Tag

Go to sales module > configuration > tags

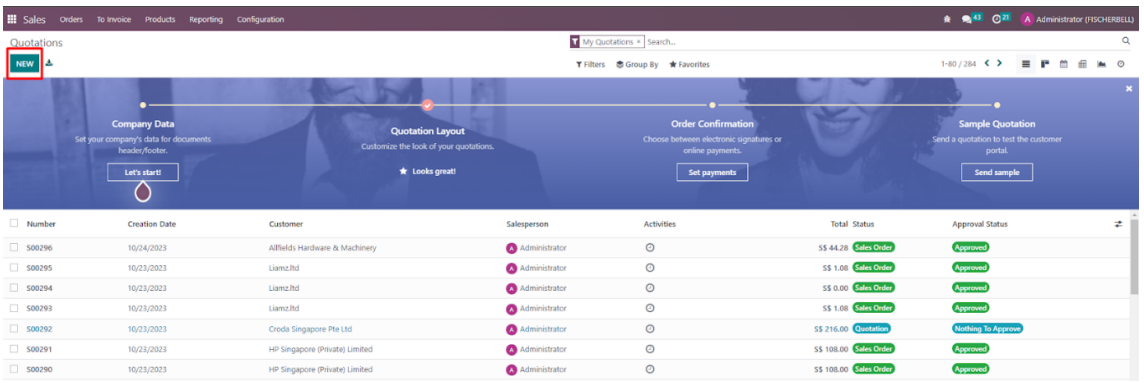


Click on new and key in the new tag name

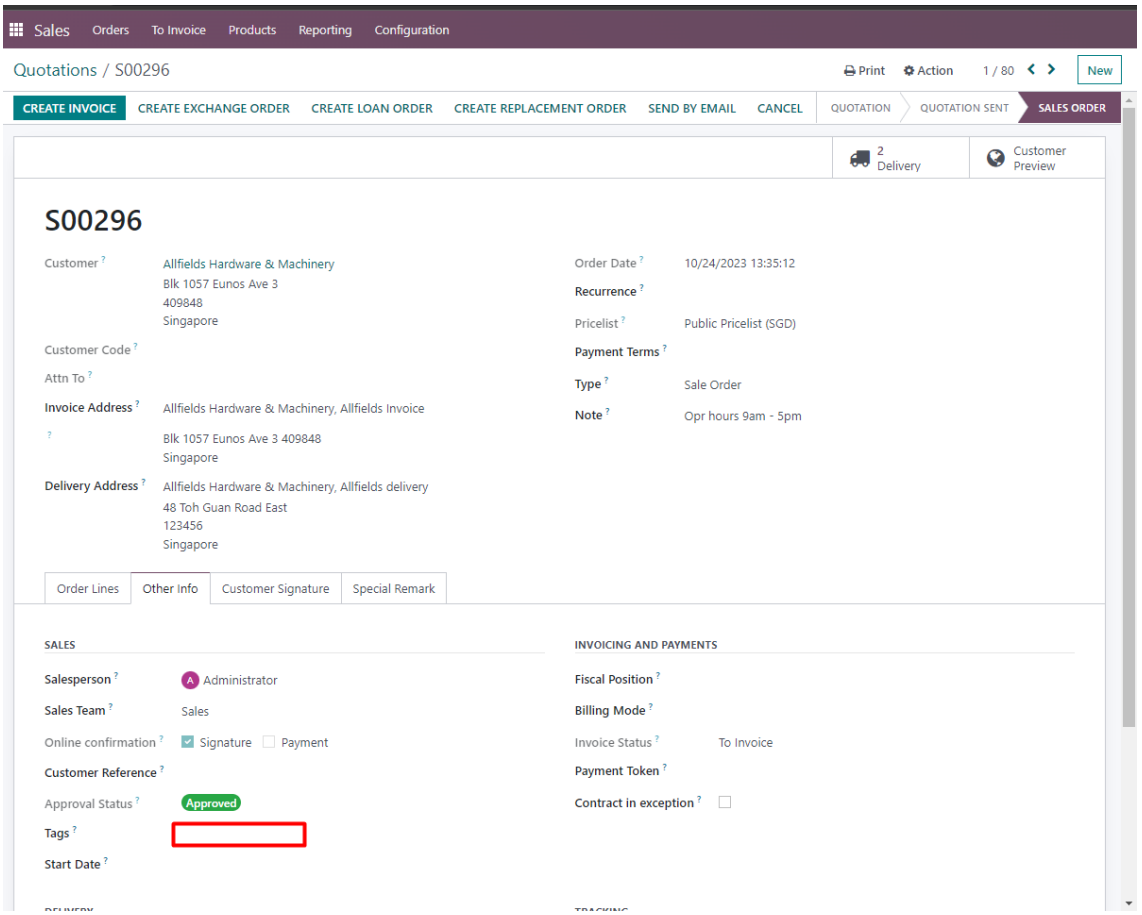


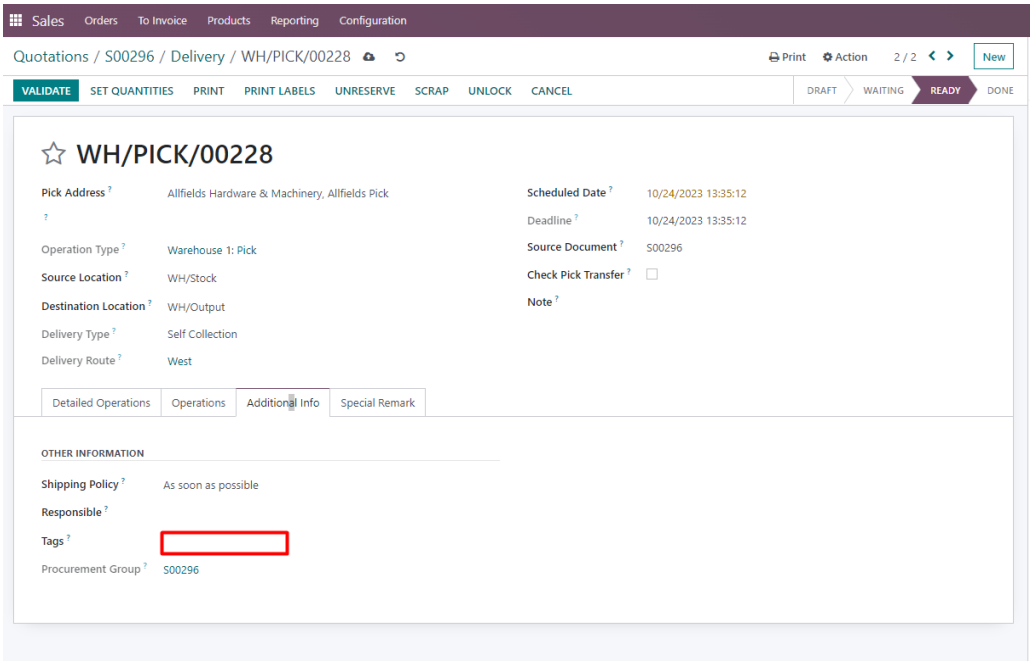
6.9.2. Using tags in a sales order

Go to the sales module and create a new quotation



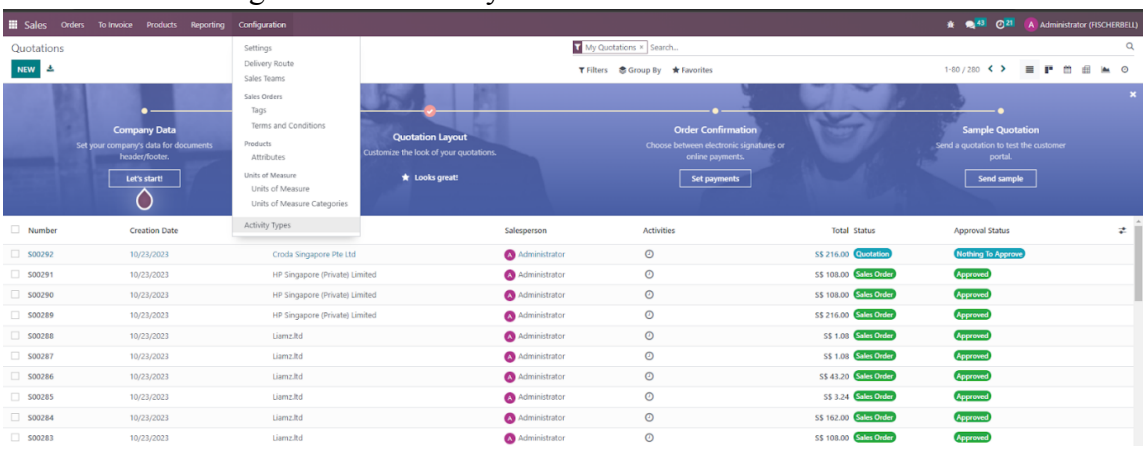
Go to the Additional information tab In here we can assign the tags here and it is also reflected in the DO



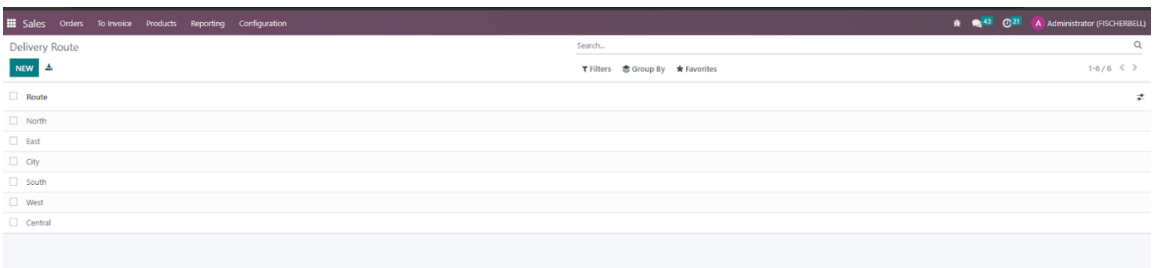


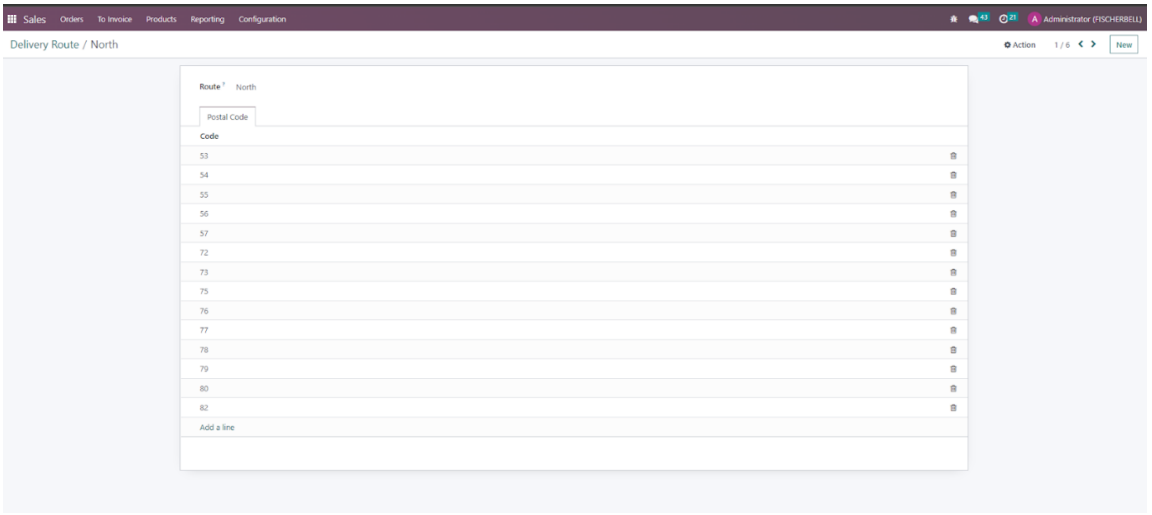
6.10. Configure Delivery Routes

Go to sales > Configuration > Delivery Route

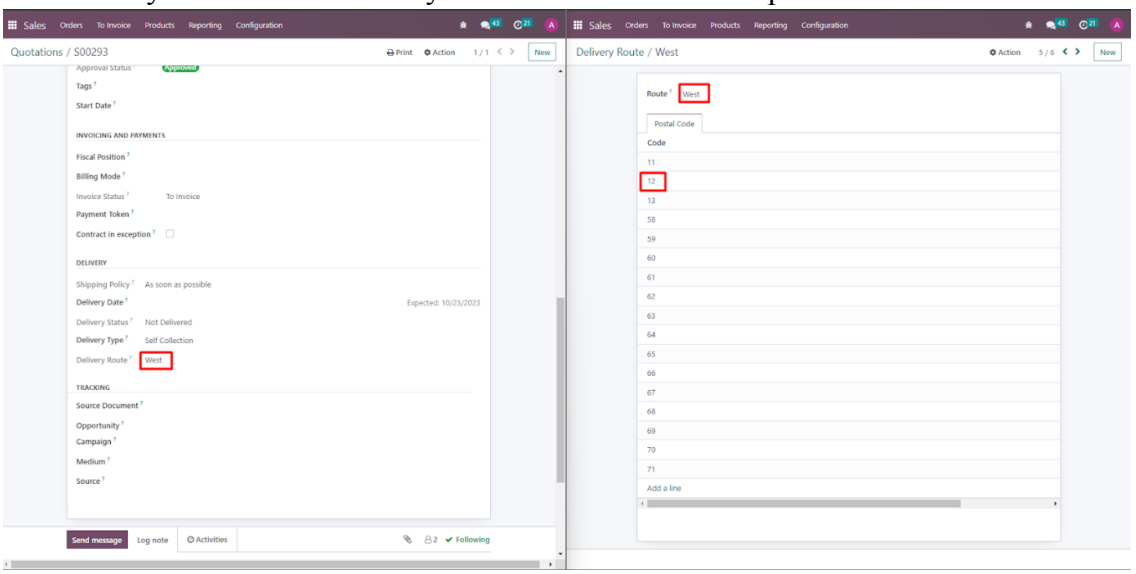


In the delivery route there will already be set delivery route according to the postal code





The delivery route is determine by the first 2 number of the postal code



6.11. Delivery type

In the sales order that you selected you can see the delivery type in other info tab which is reflected in the DO

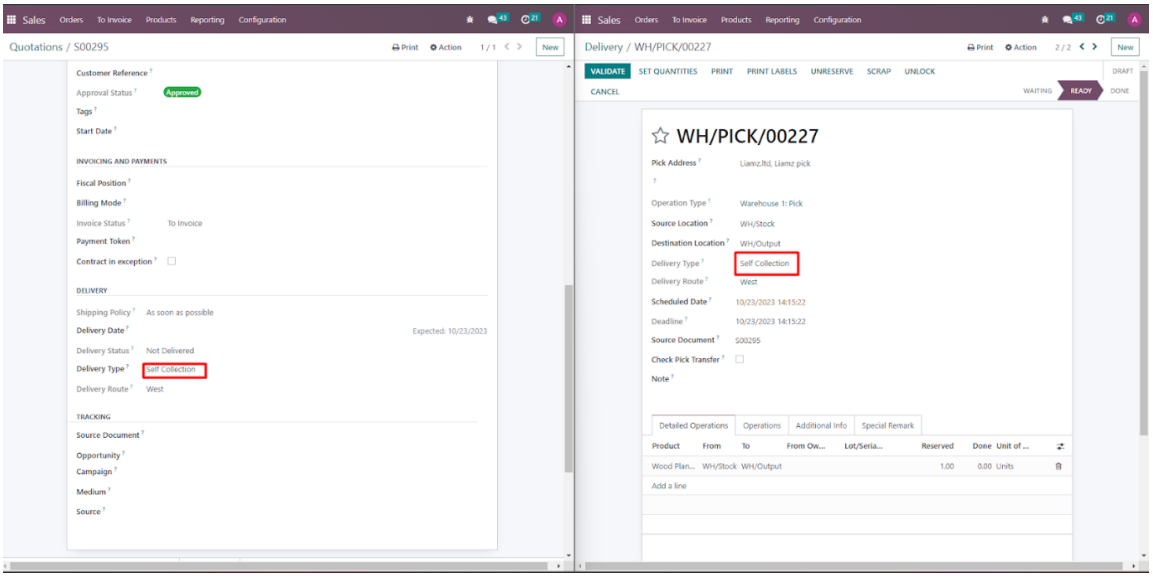
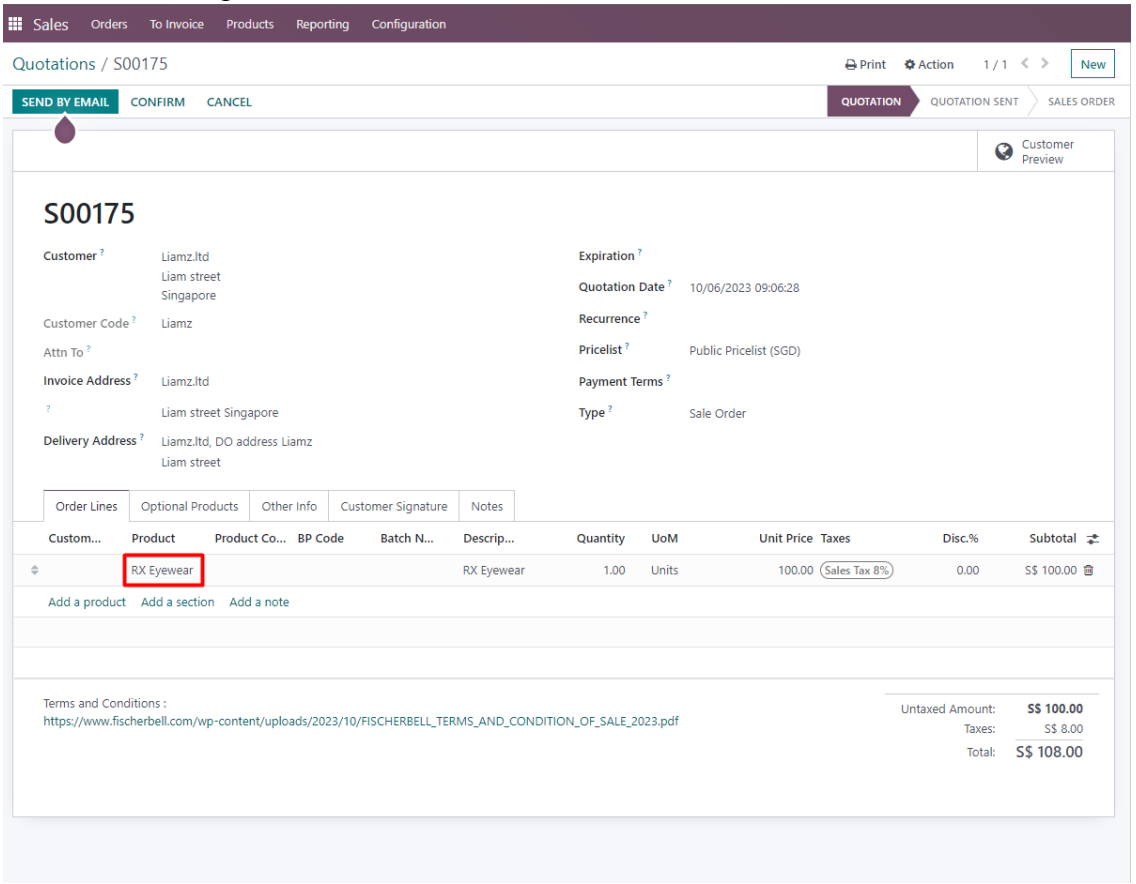
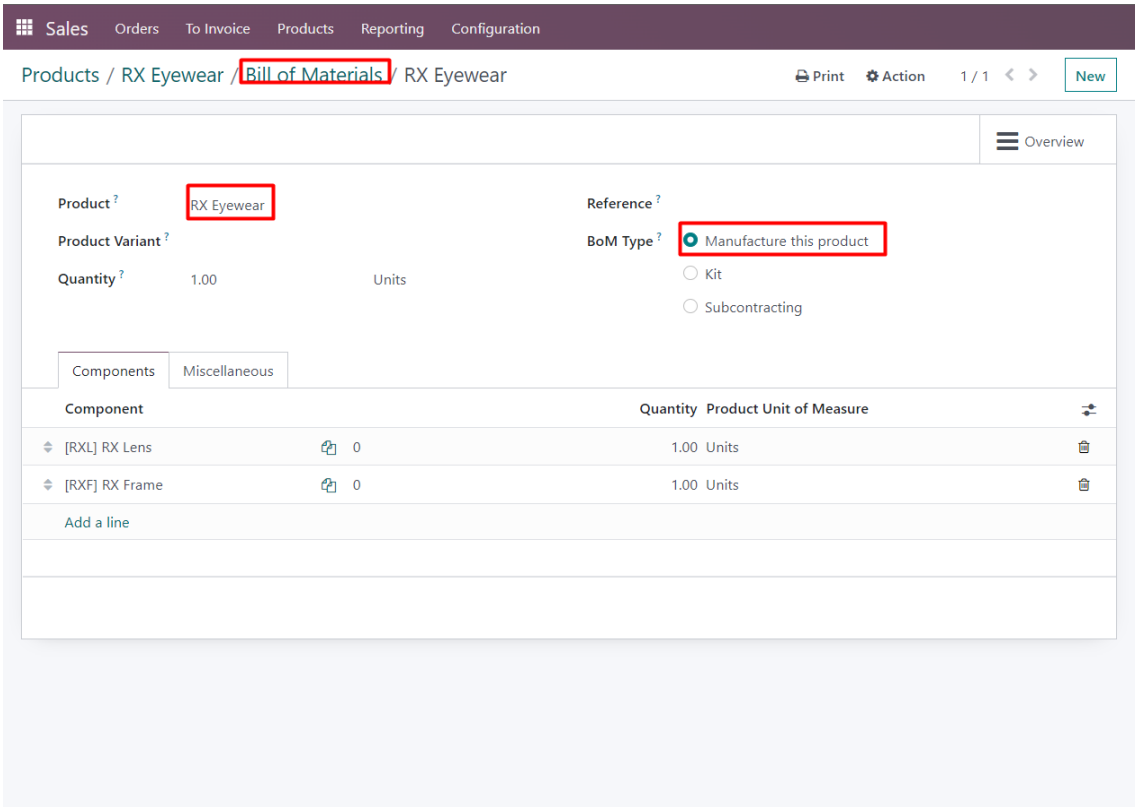
Reflected in DO



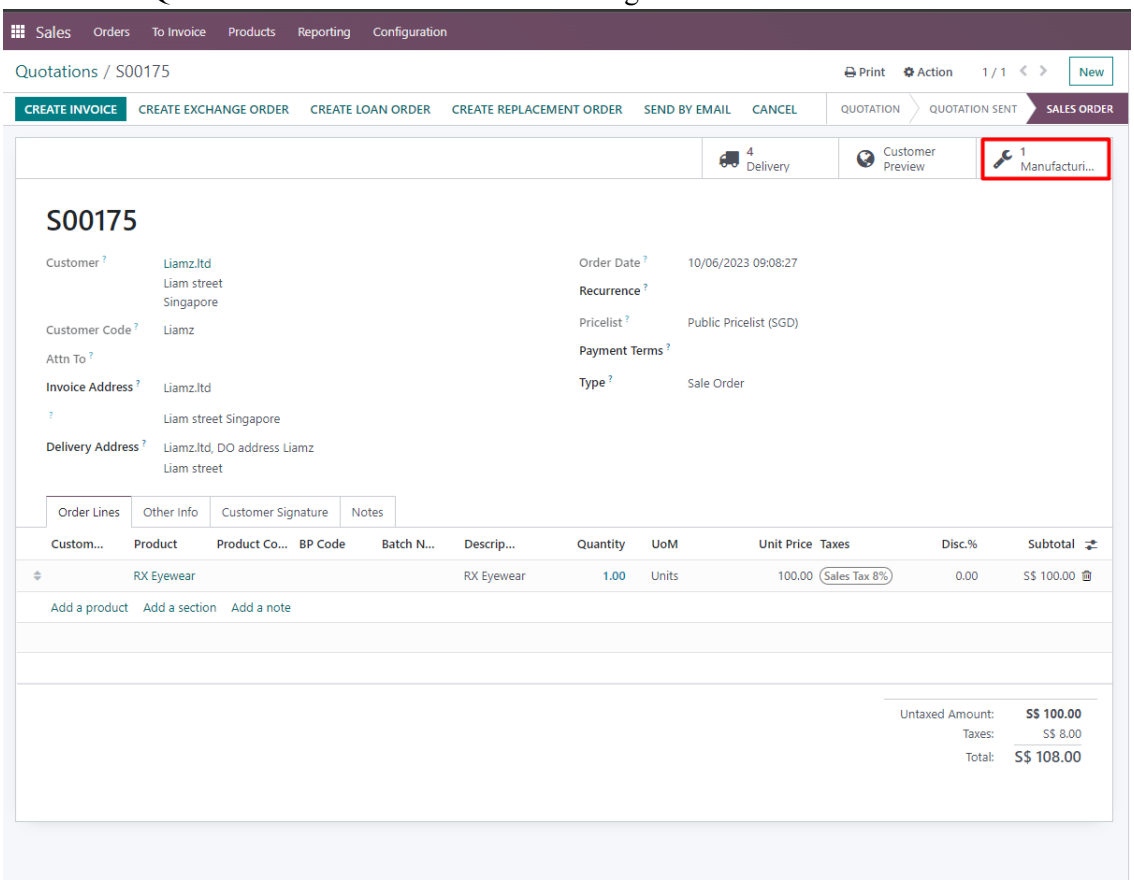
6.12. RX Frame flow

Go to the sales module and create a Quotation for RX eyewear that has BOM and set to manufacture this product

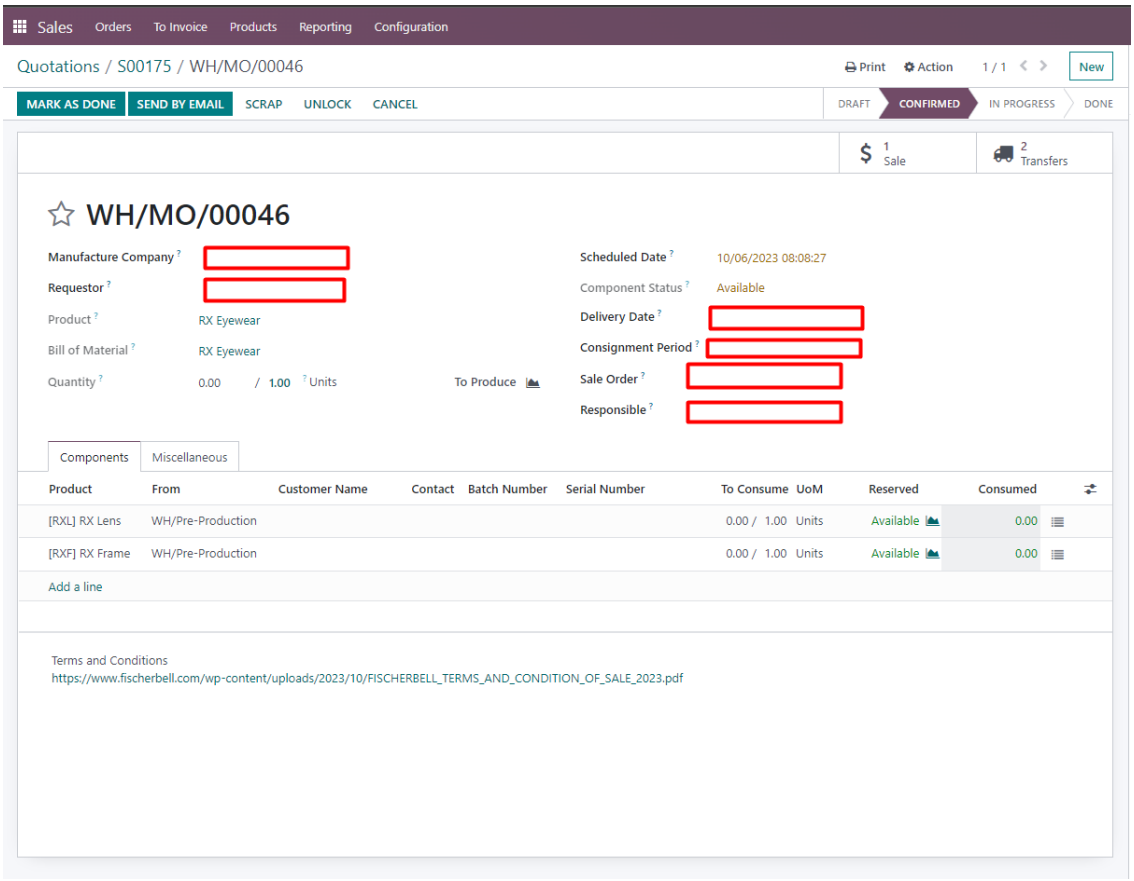




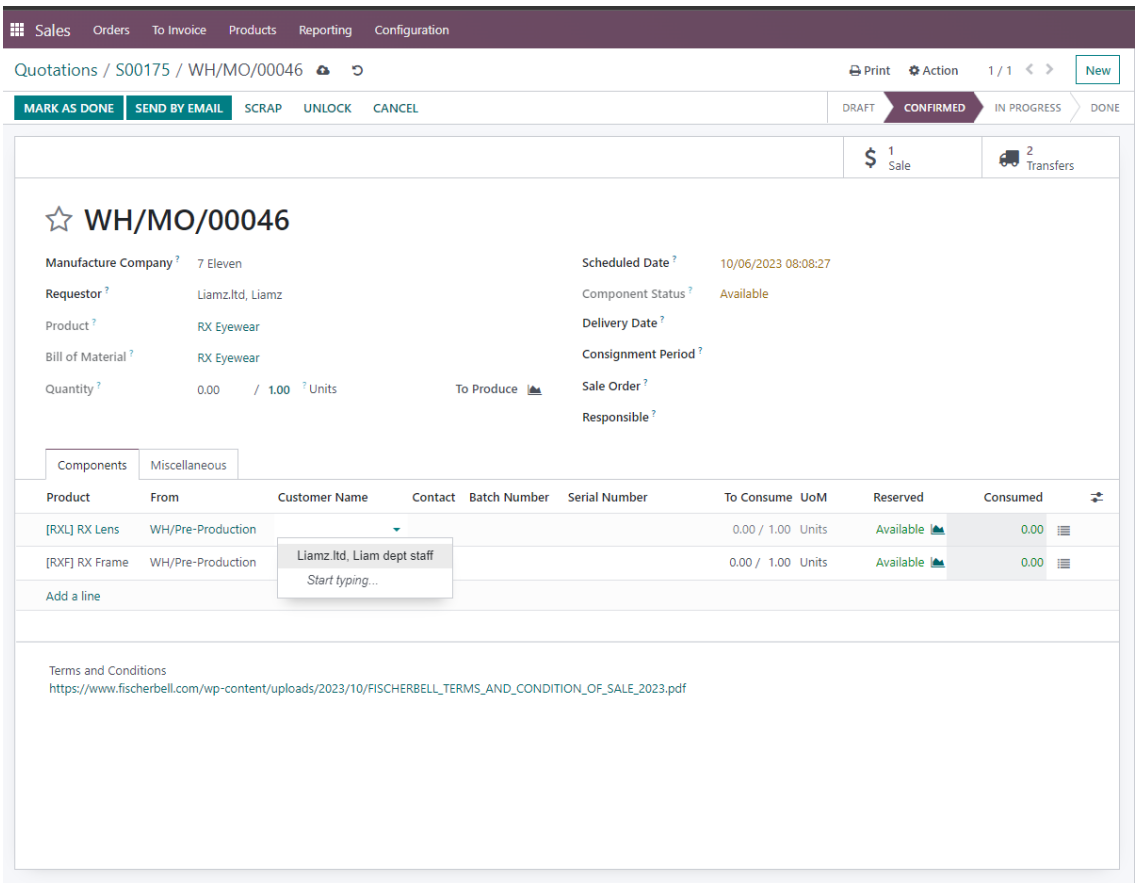
Confirm the Quotation and click on the manufacturing smart button



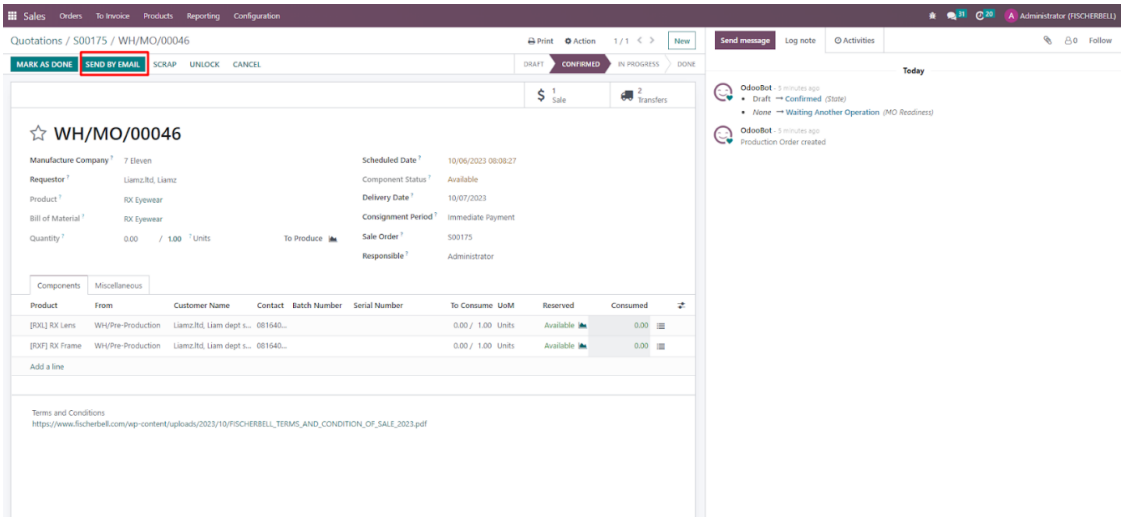
Fill in information for the necessary fields

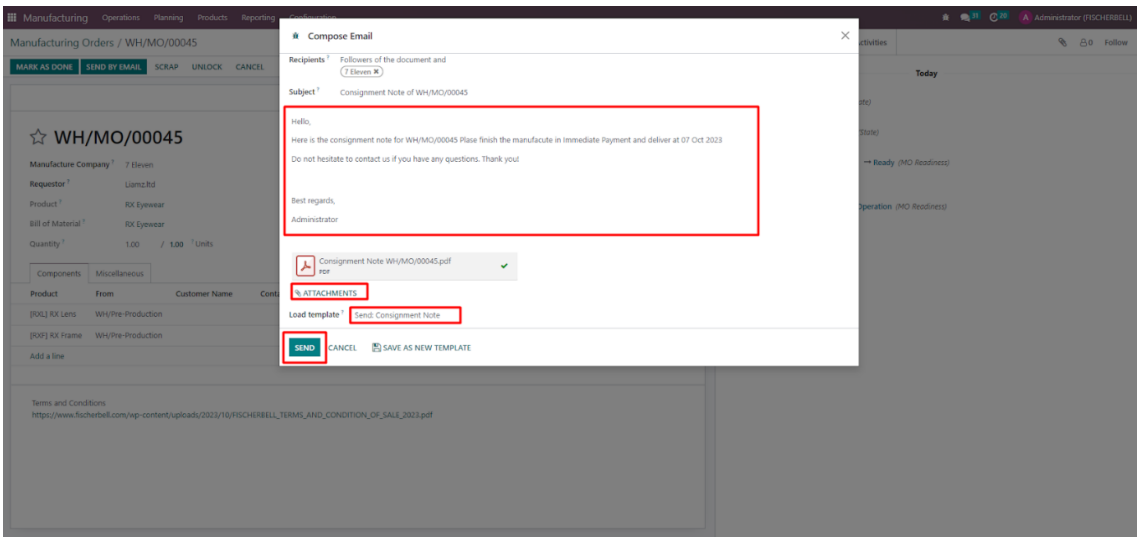


Assign the staff name

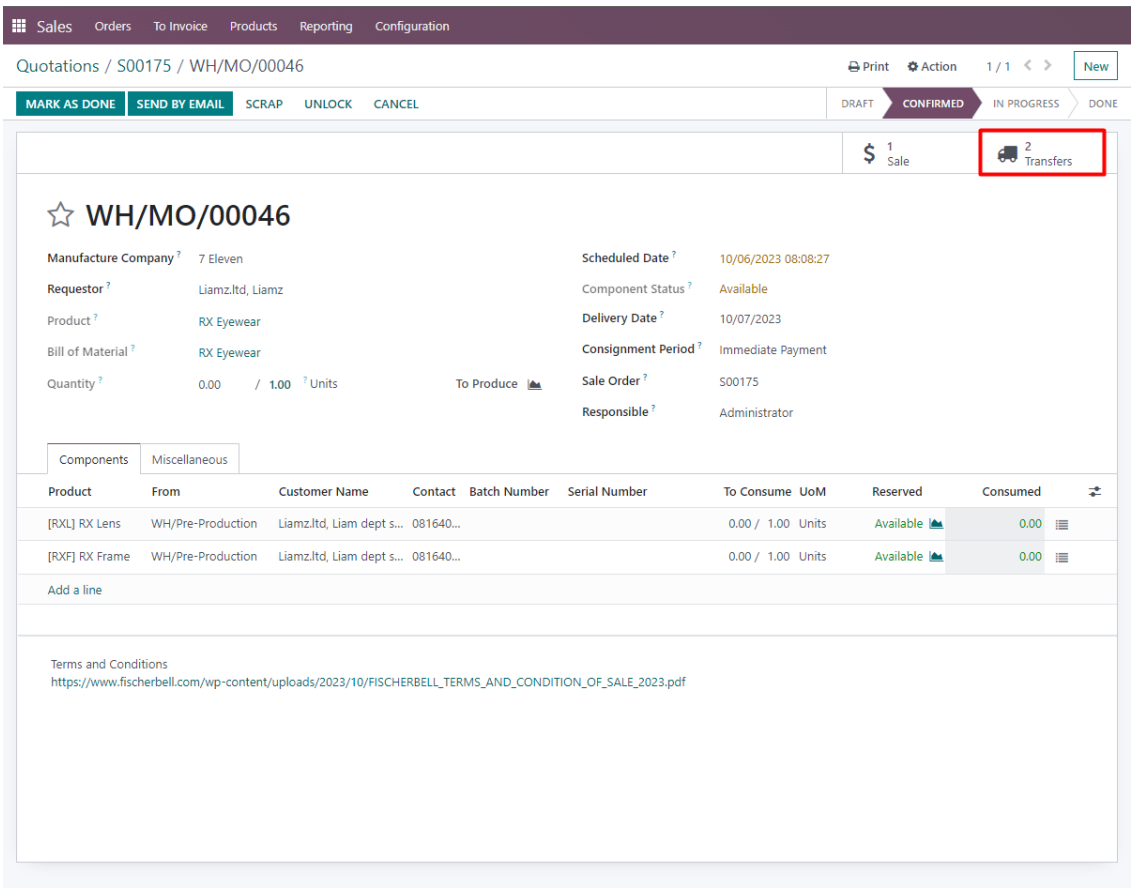


Send consignment note via email, you can key in the contents and attach more file along with the consignment note

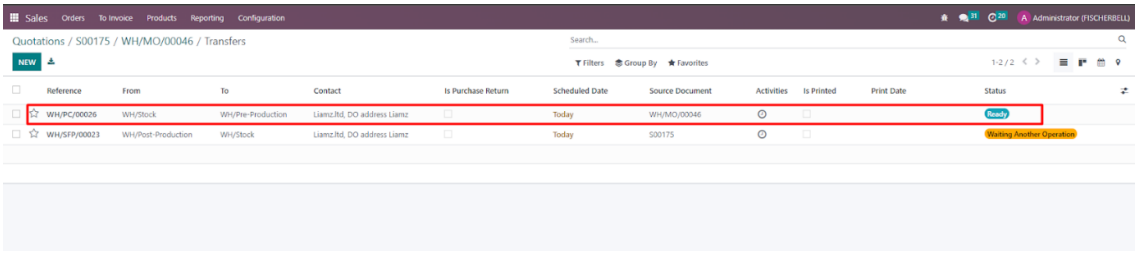




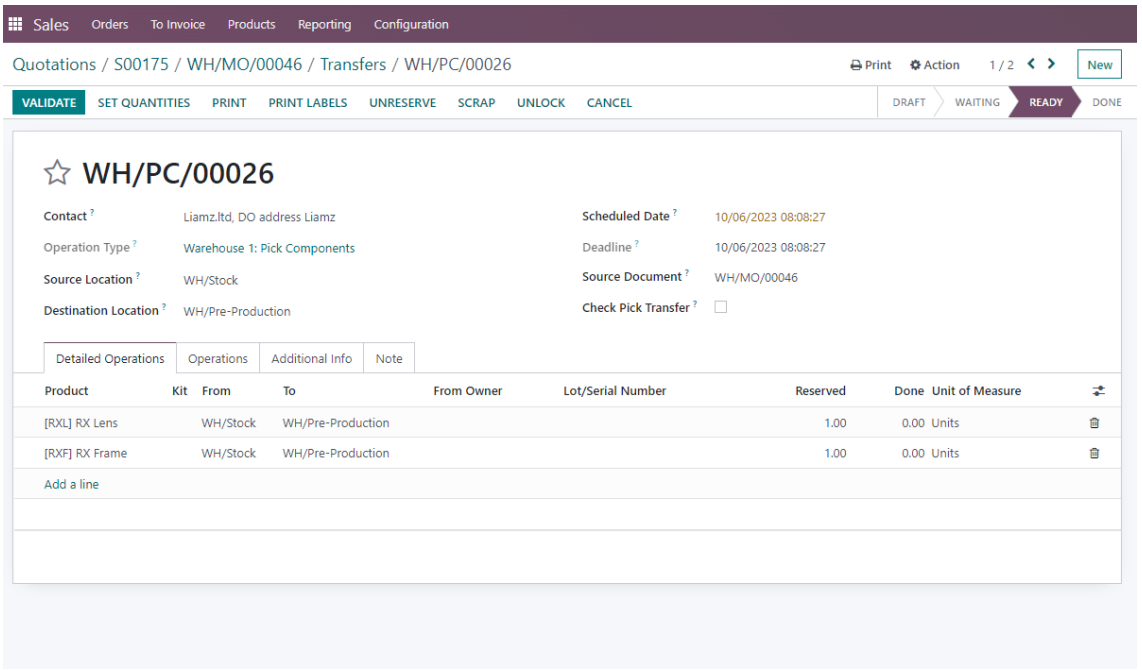
Click on transfers

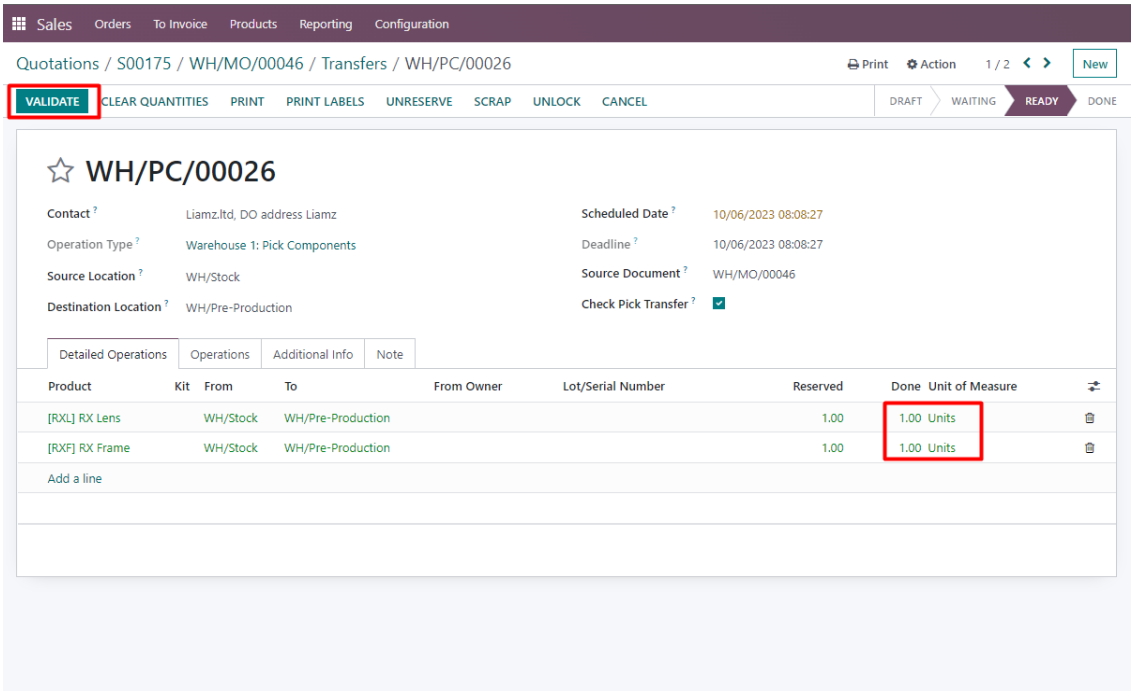


Click on WH/PC first

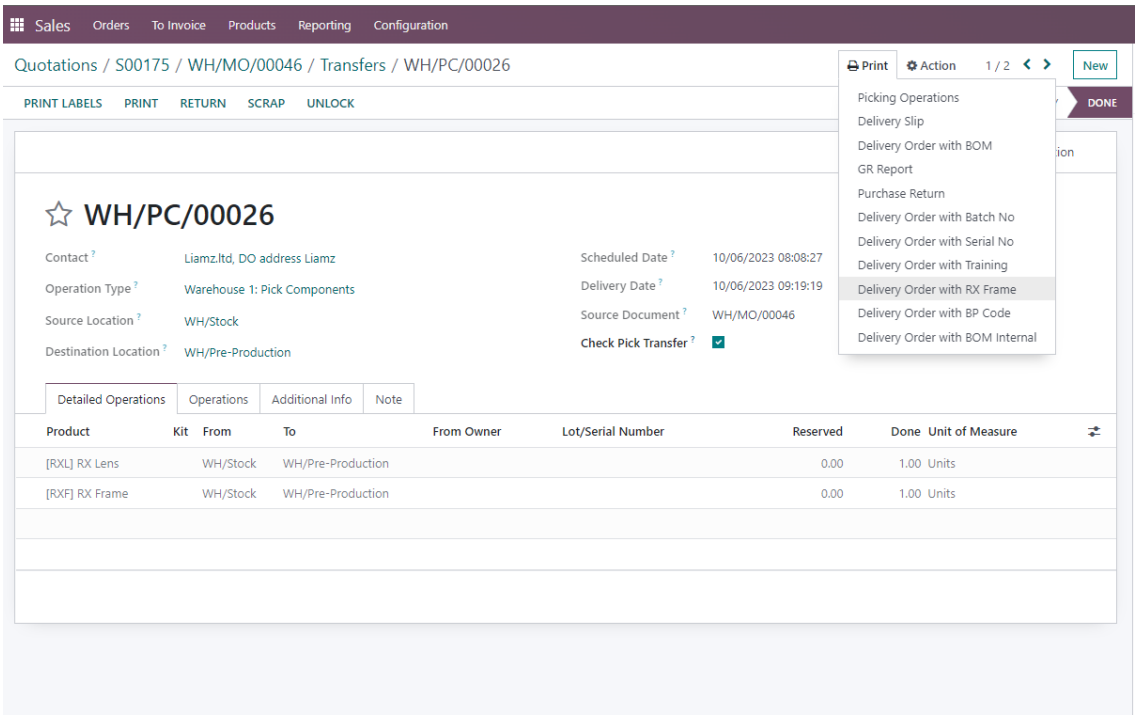


Validate the product

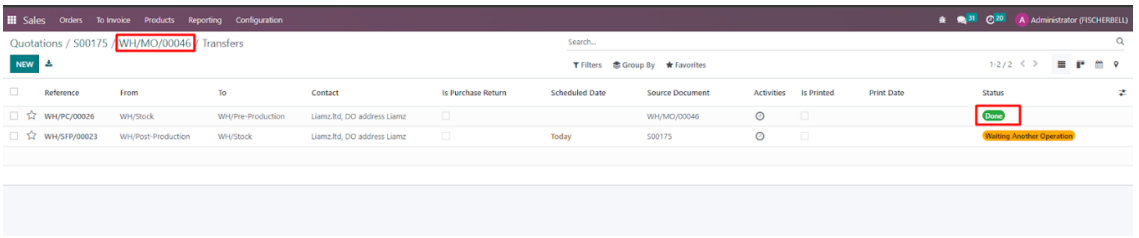




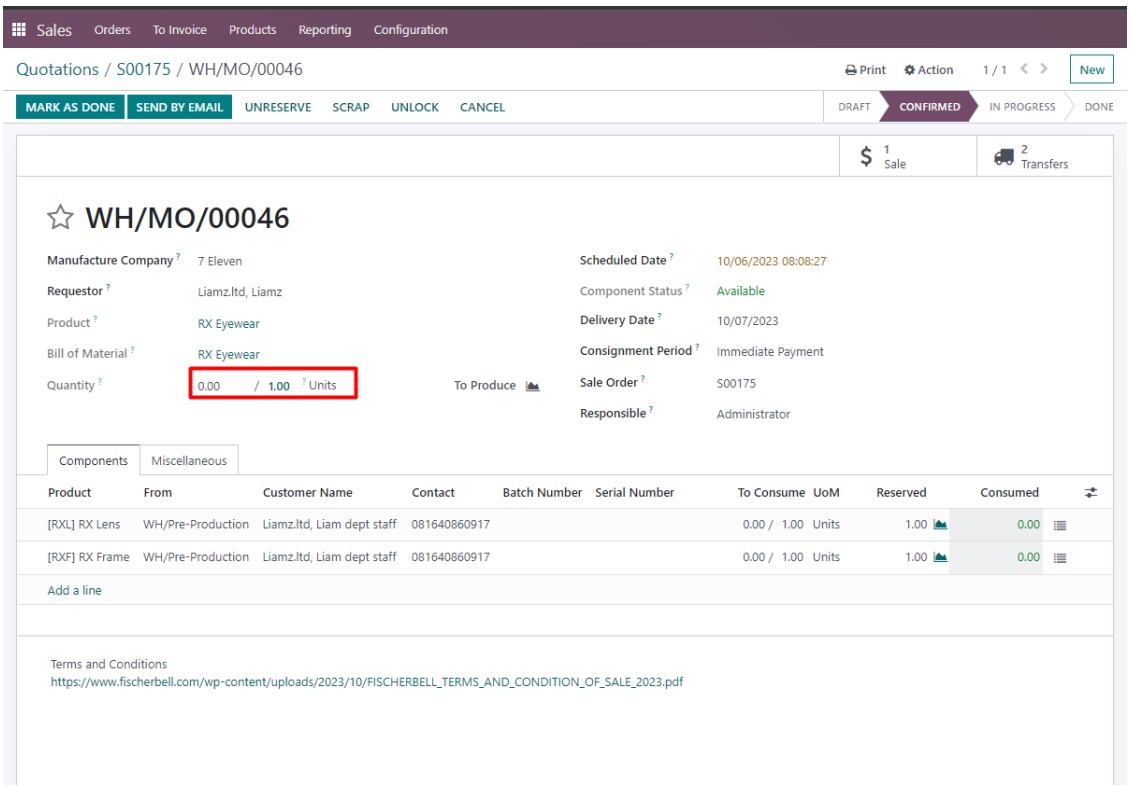
Once we validate Print DO w RX frame here



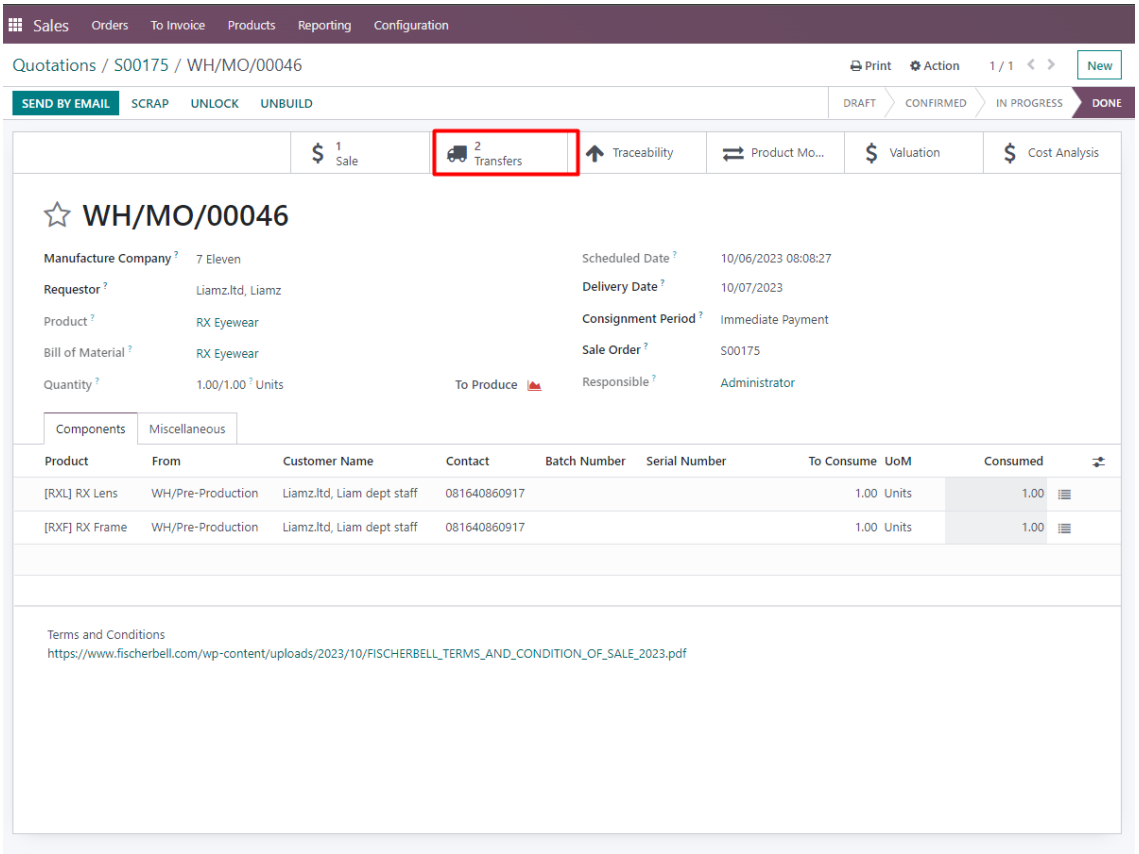
Once we validate it go back to the MO



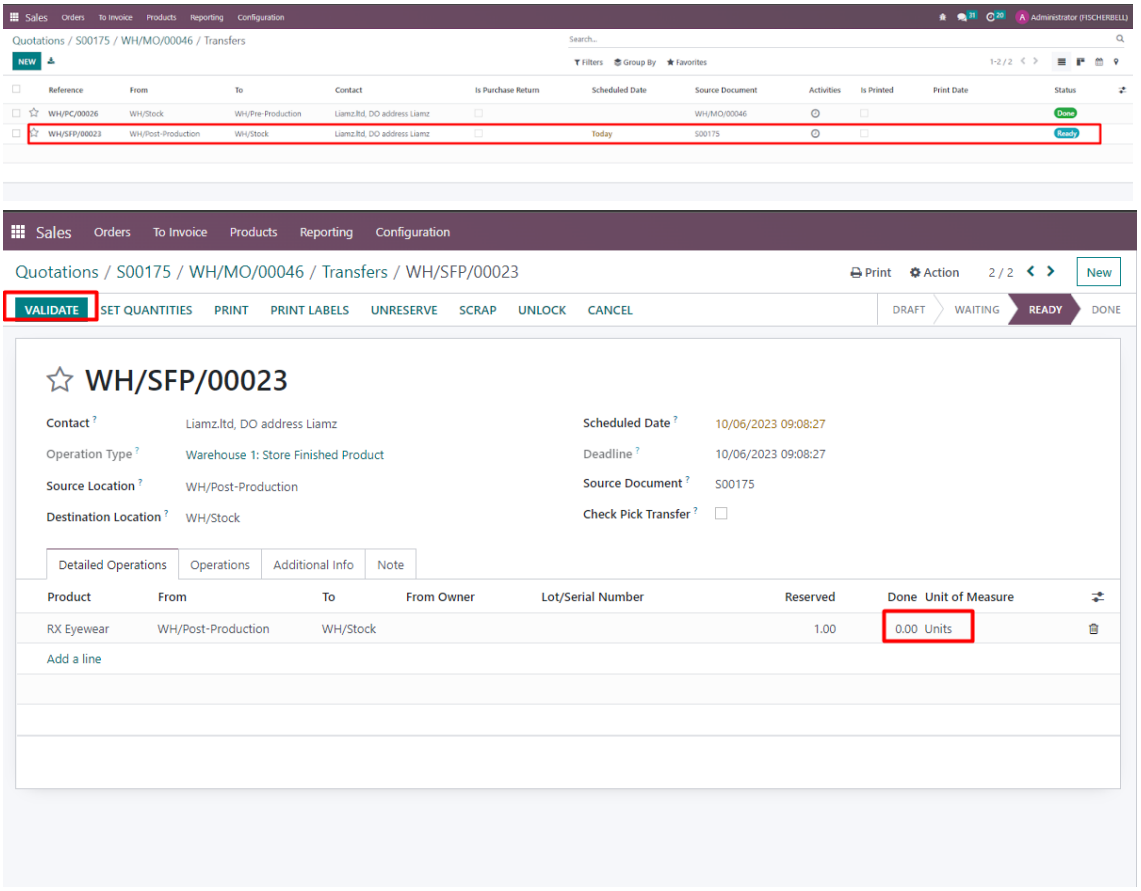
Validate done quantity and mark as done



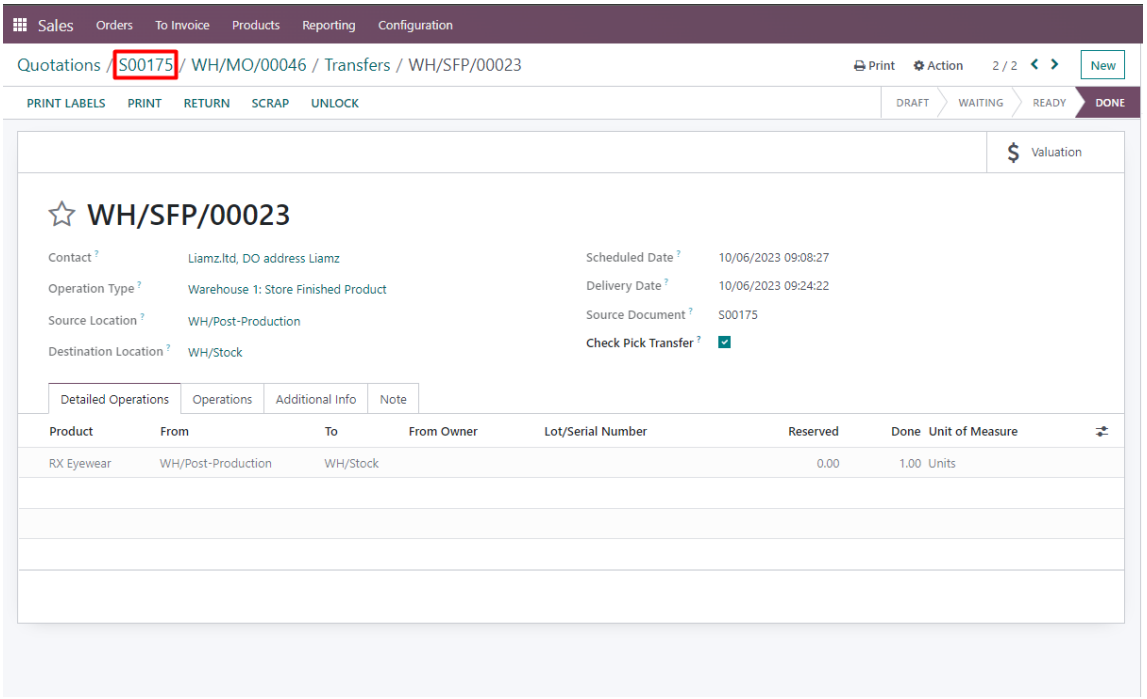
Go back to transfer



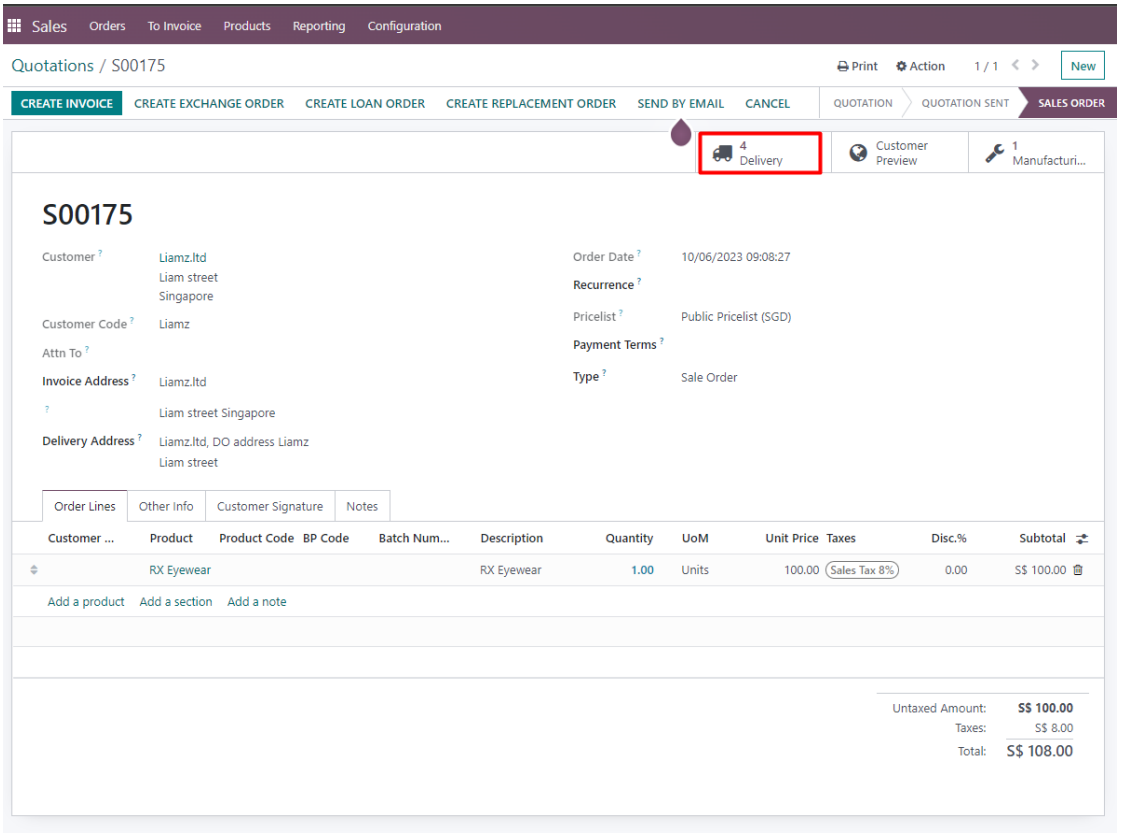
Validate the manufactured item



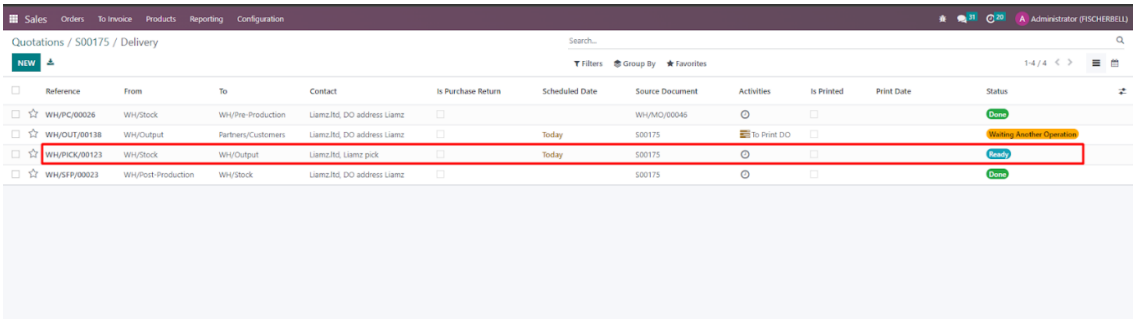
Once validate go to back to the SO



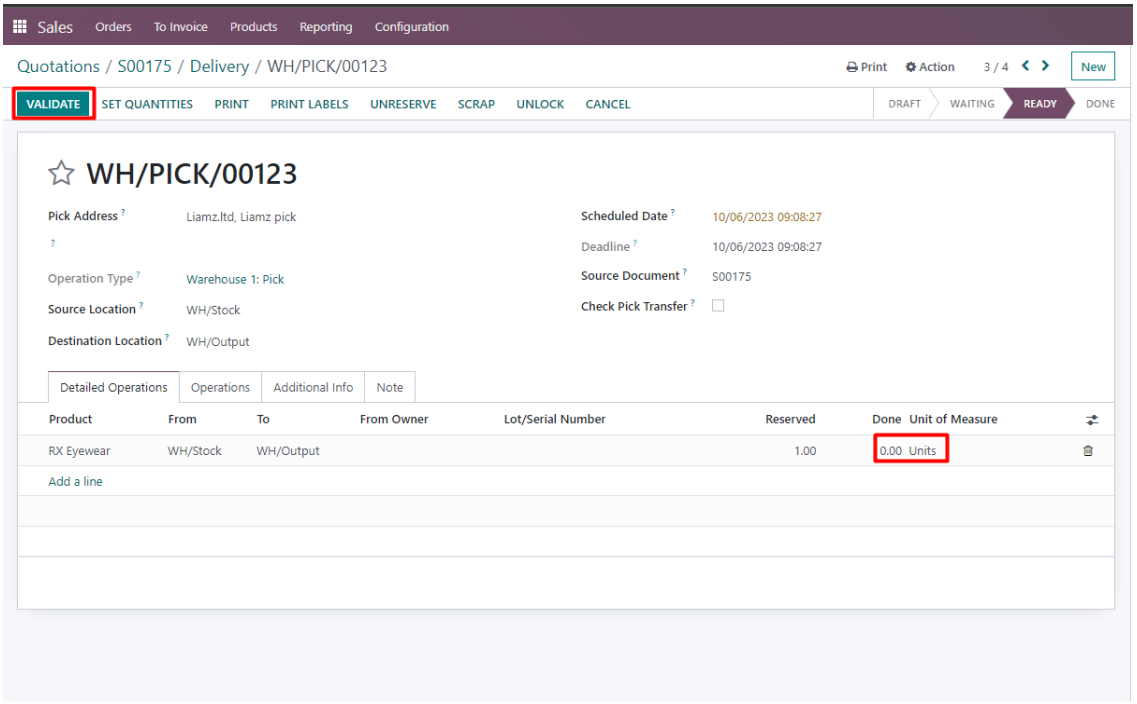
Go to Delivery



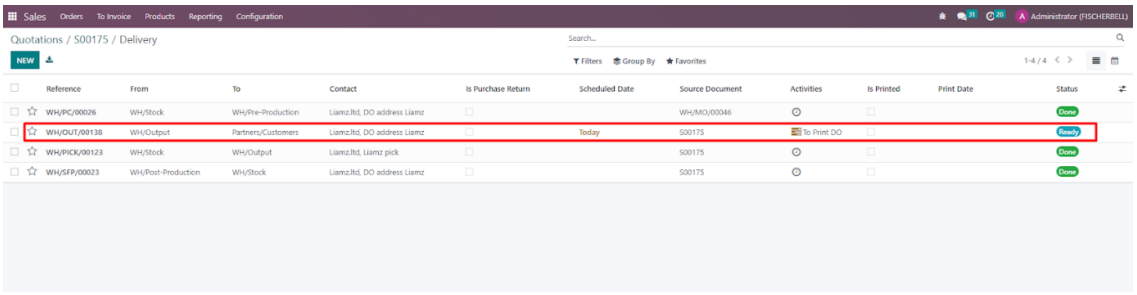
Choose WH/PICK



Validate the PICK

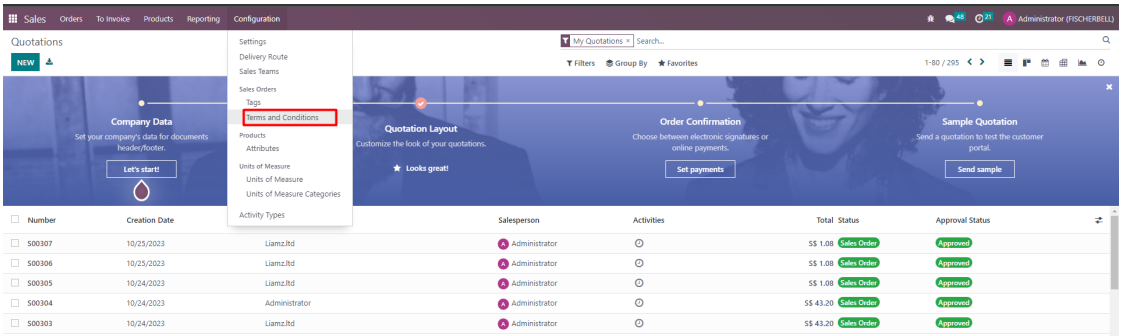


Validate the DO

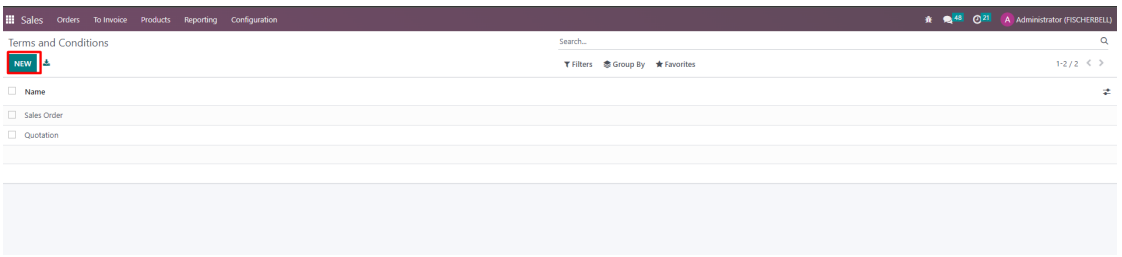


6.13. Assign Terms and condition for SO and INV

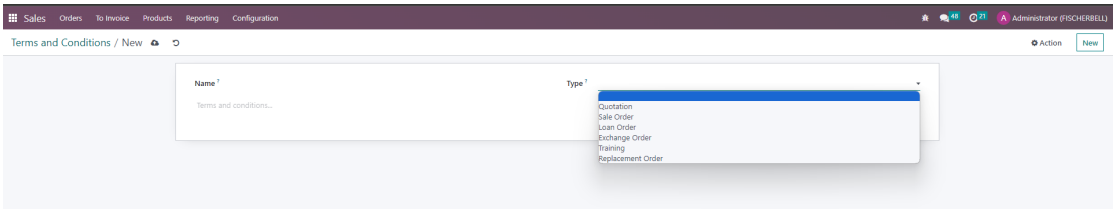
To assign terms and condition we need to go to the sales module > configuration > Terms and condition



In here the terms and condition menu user can assign a new terms by clicking the new button on the top left

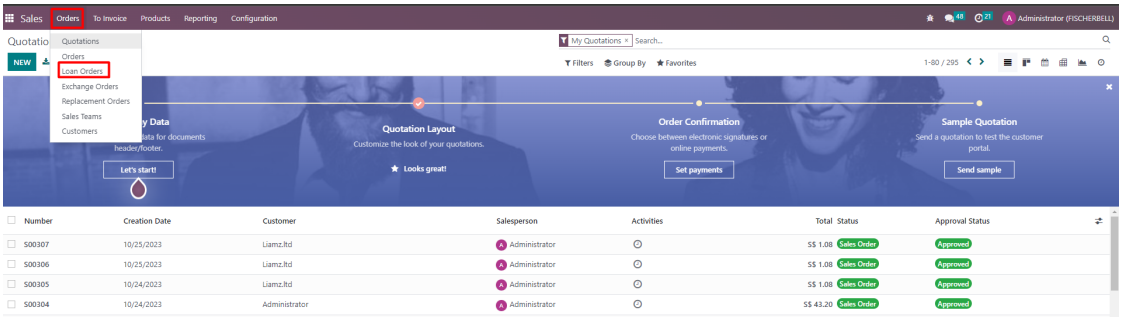


When creating a new terms and condition users can key in the name, determine the type and the contents



6.14. Creating Loan orders

When creating loan orders there are 2 method to do it, with the first method user need to go to sales module > order > loan order



The second method is in one of the selected SO and click on this create loan order button and the system will automatically make a loan order for you

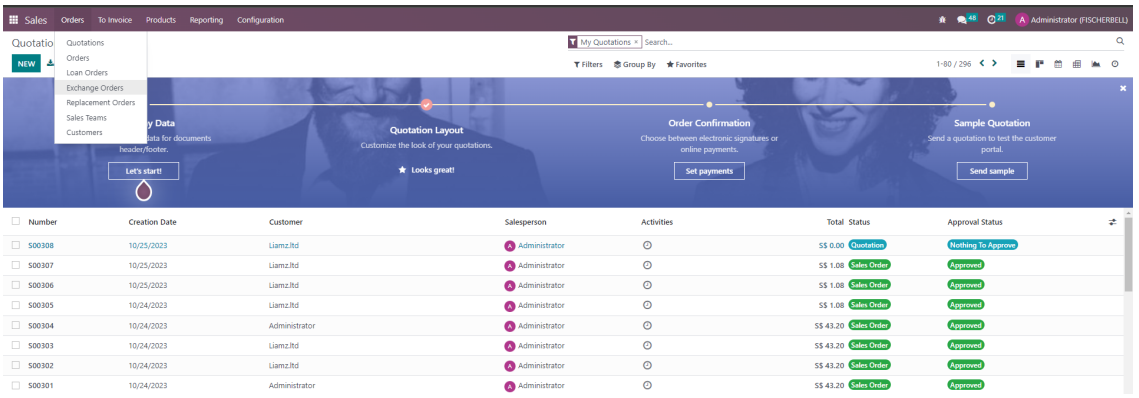
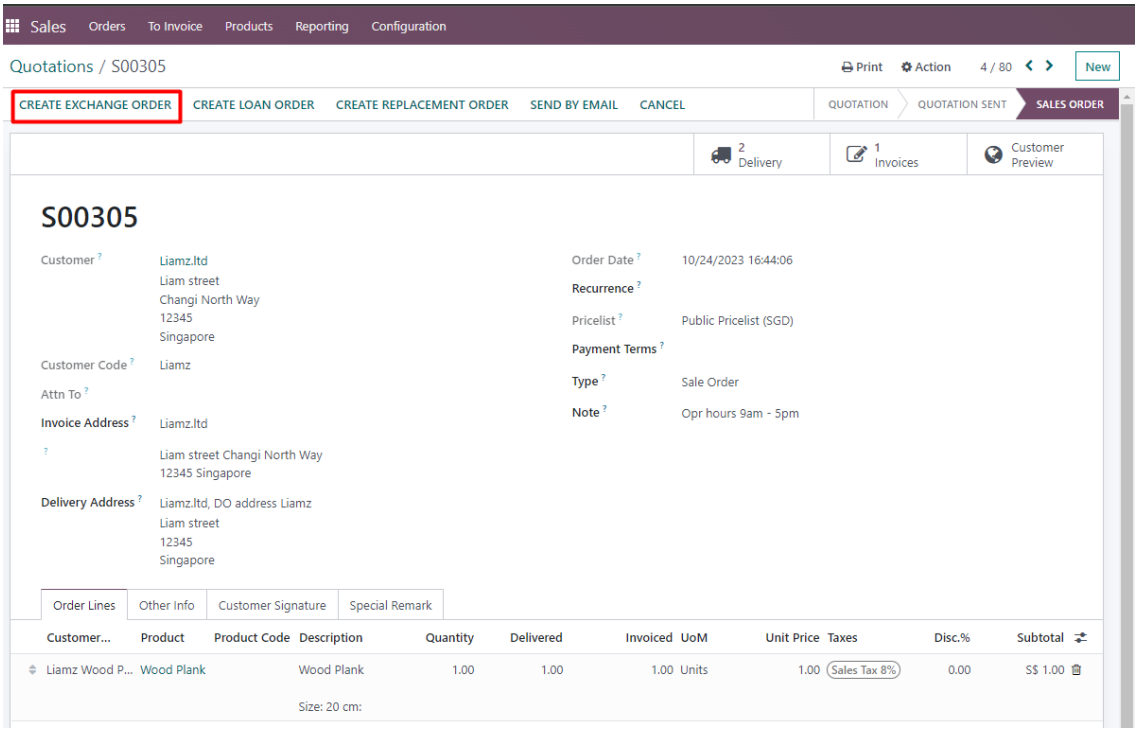
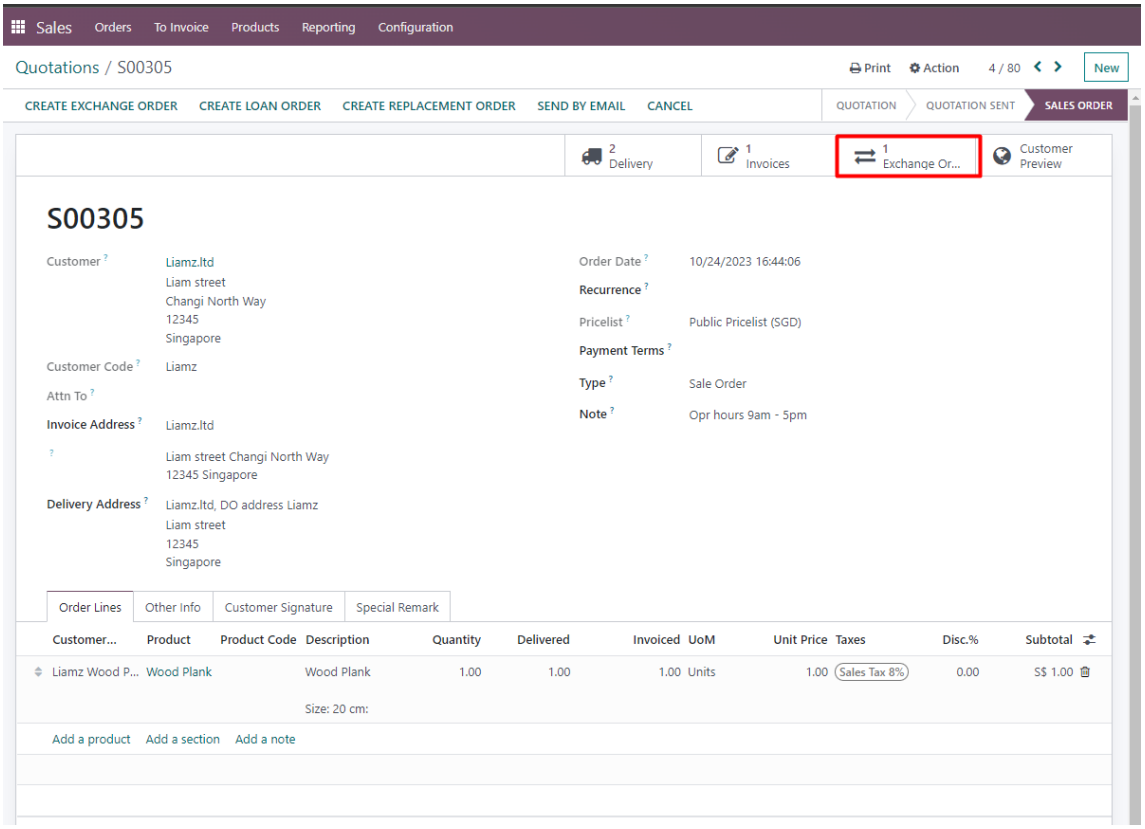
6.15. Creating a Exchange order

When creating exchange orders there are 2 method to do it, with the first method user need to go to sales module > order > exchange order



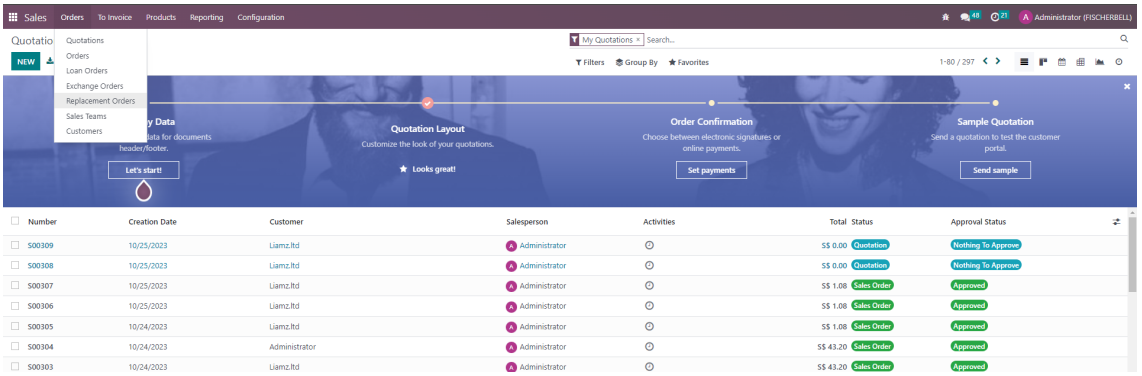
The second method is in one of the selected SO and click on this create loan order button and the system will automatically make a loan order for you



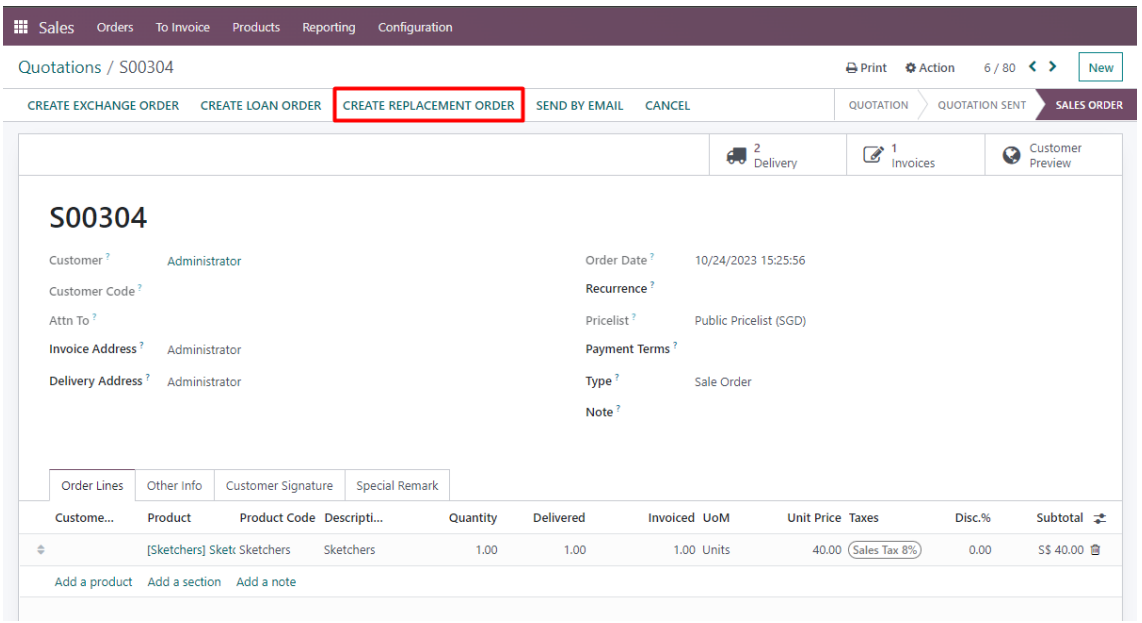


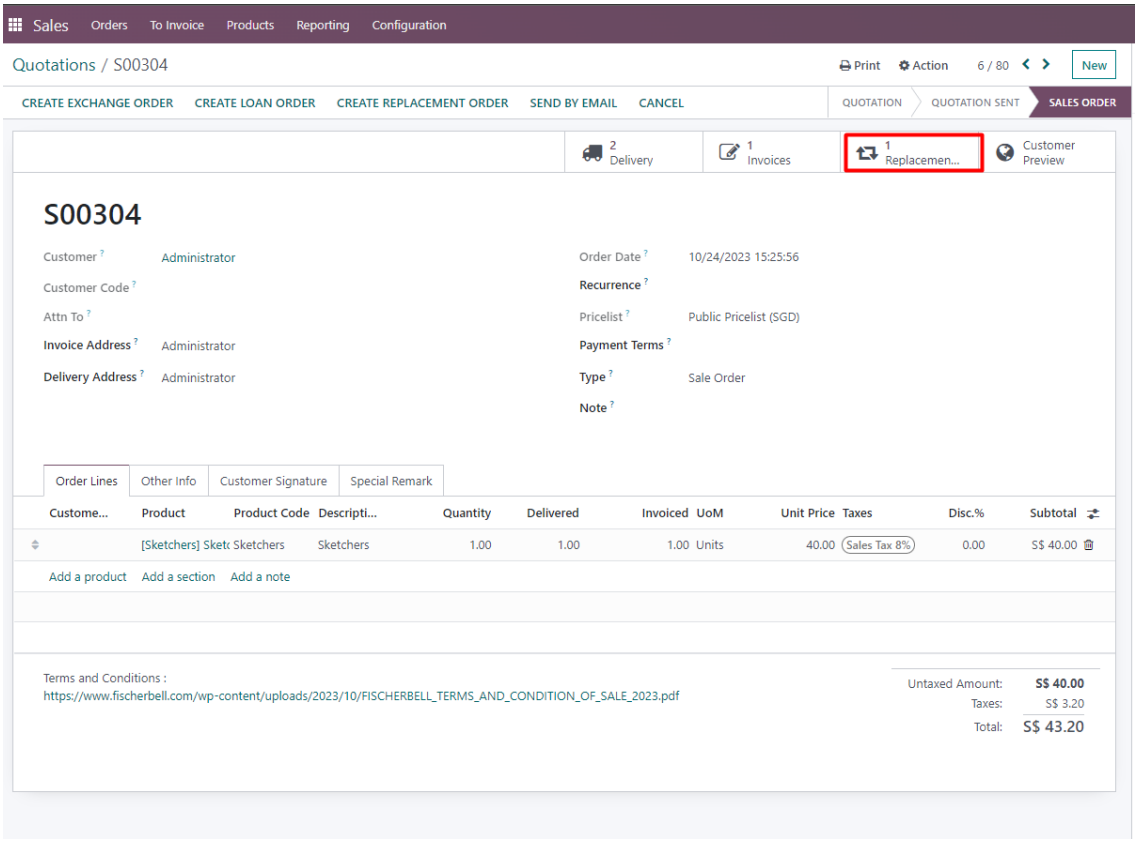
6.16. Creating a Replacement order

When creating exchange orders there are 2 method to do it, with the first method user need to go to sales module > order > replacement order



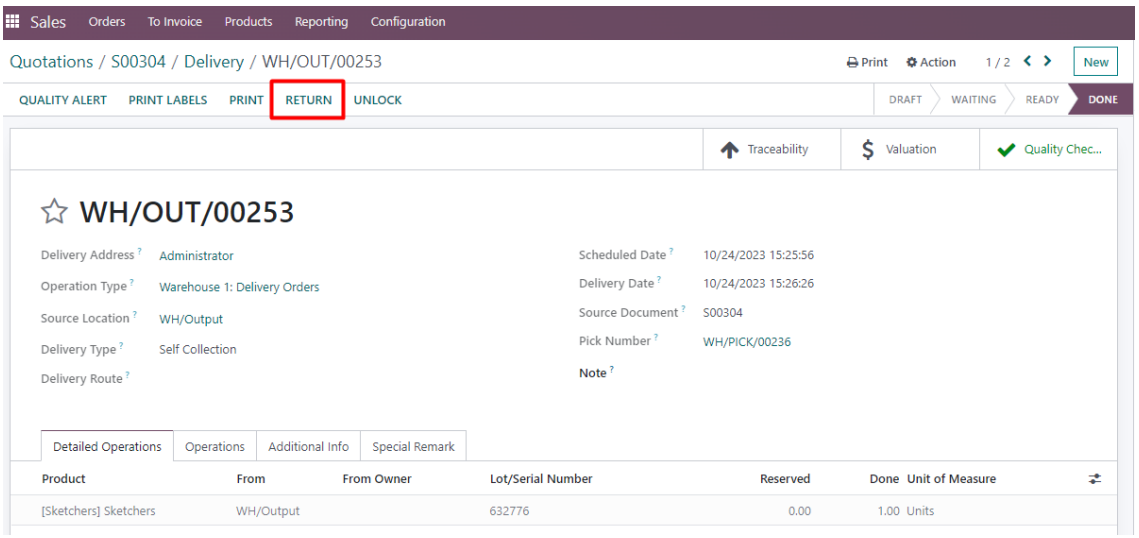
The second method is in one of the selected SO and click on this create loan order button and the system will automatically make a loan order for you



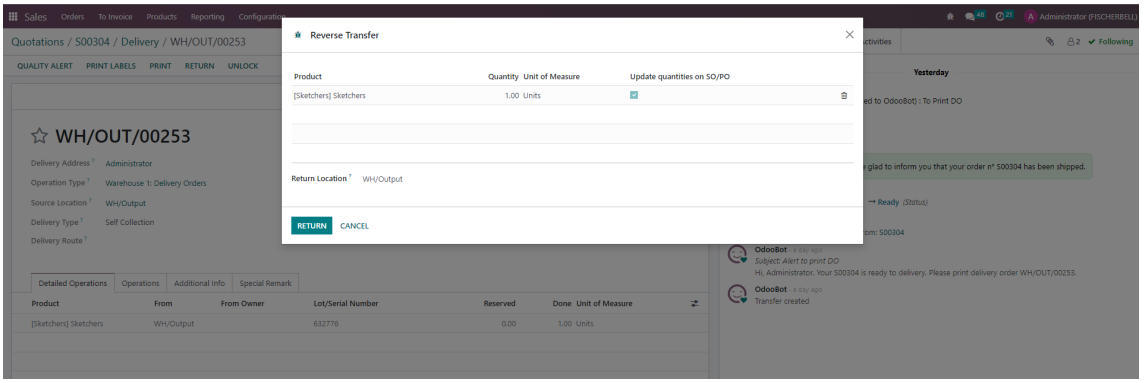


6.17. Creating a order return

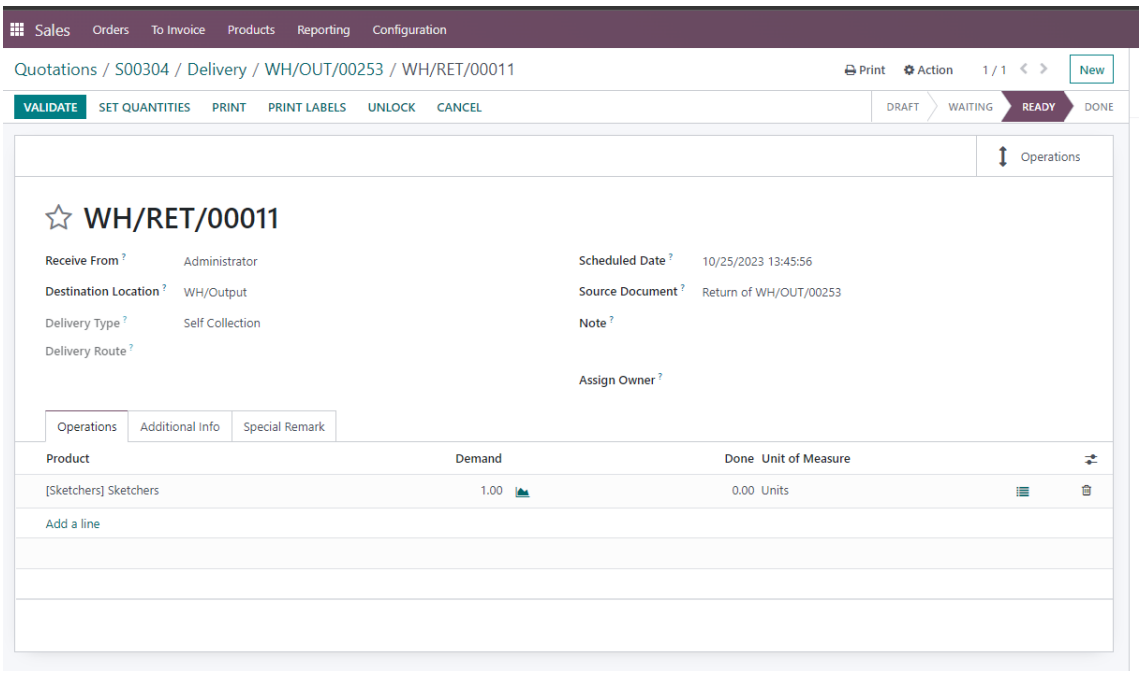
In sales and in one of the selected DO that has been validated, click on return

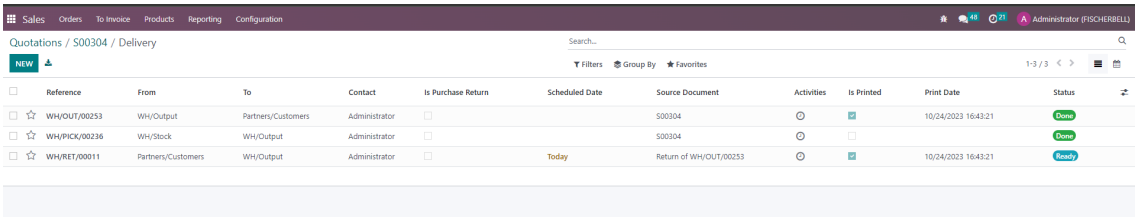


Once you click on return you will see a pop up where you can set the product, quantity, and the return location



Once you've set the correct information for it click validate and the system will automatically create it for you

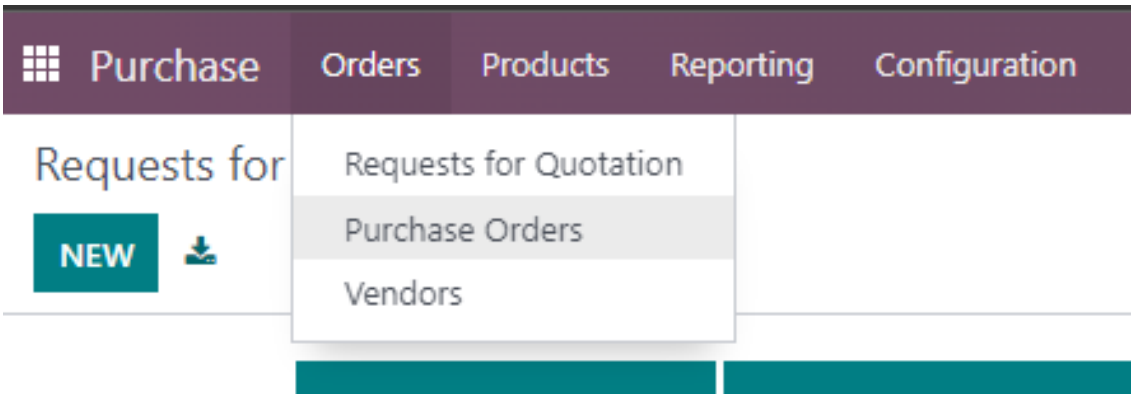


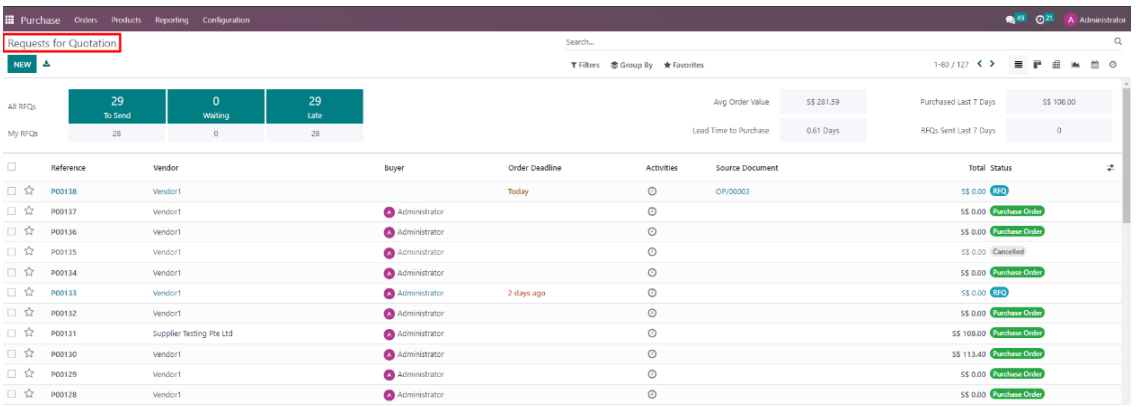


7. Purchase

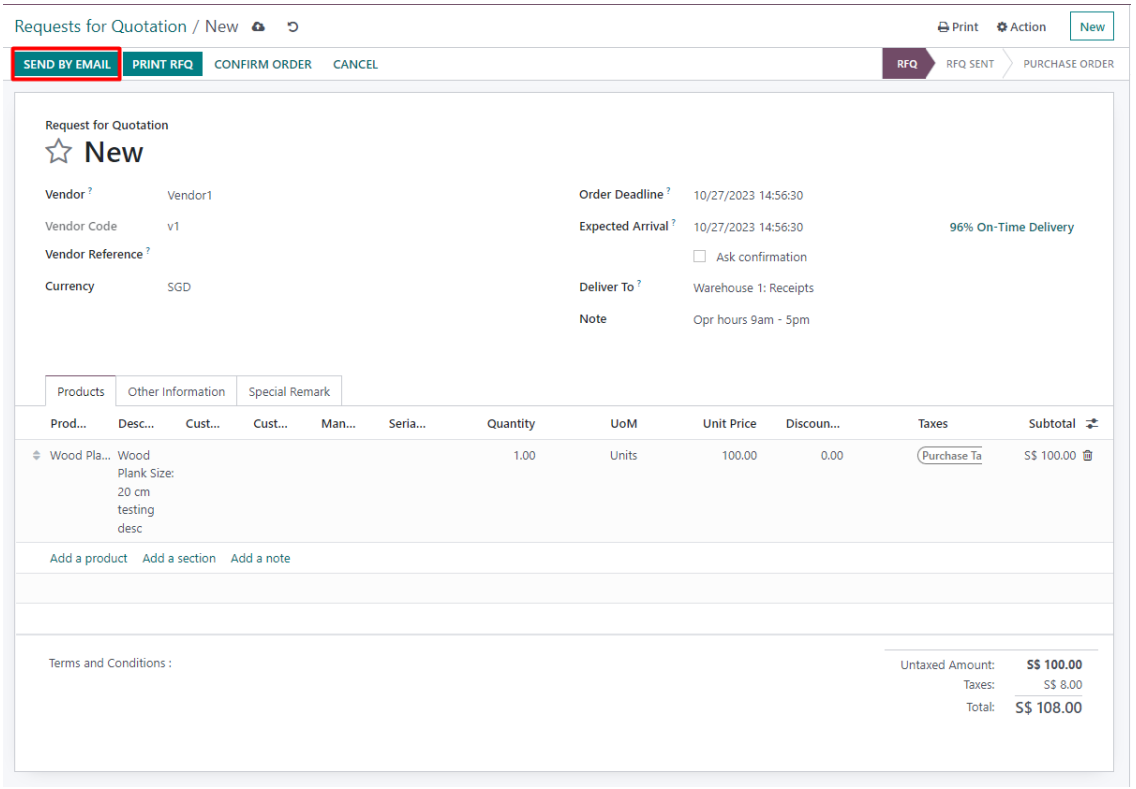
7.1. Create RFQ

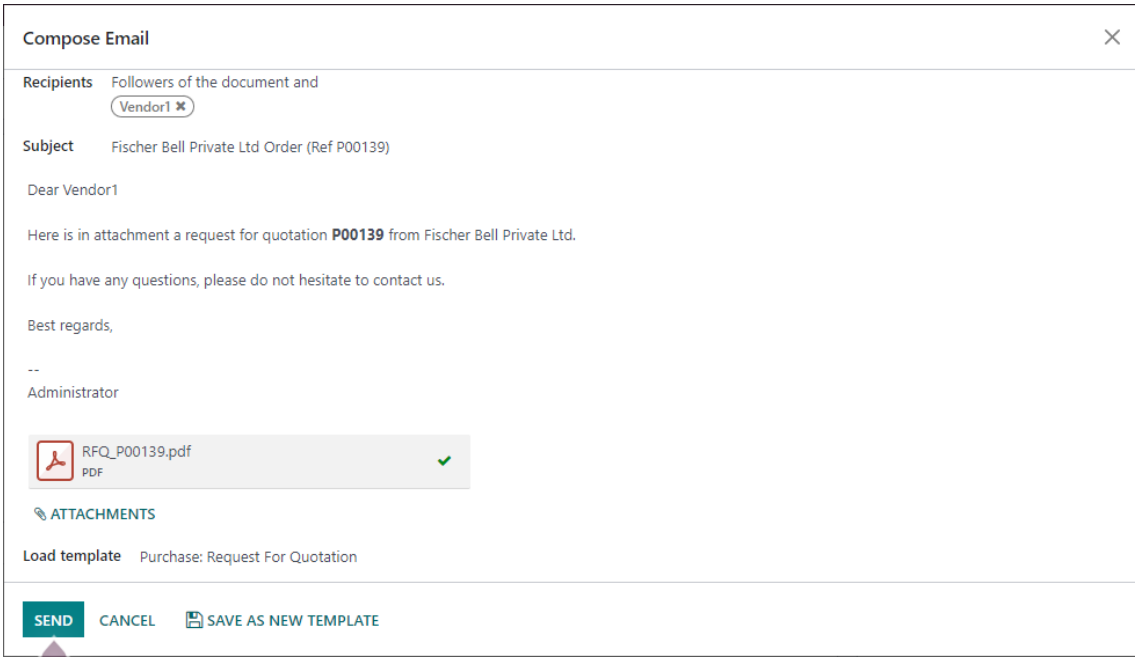
First, you can go to the purchase menu. Click Orders and choose Request for quotation. You can create an RFQ by clicking the Create button.

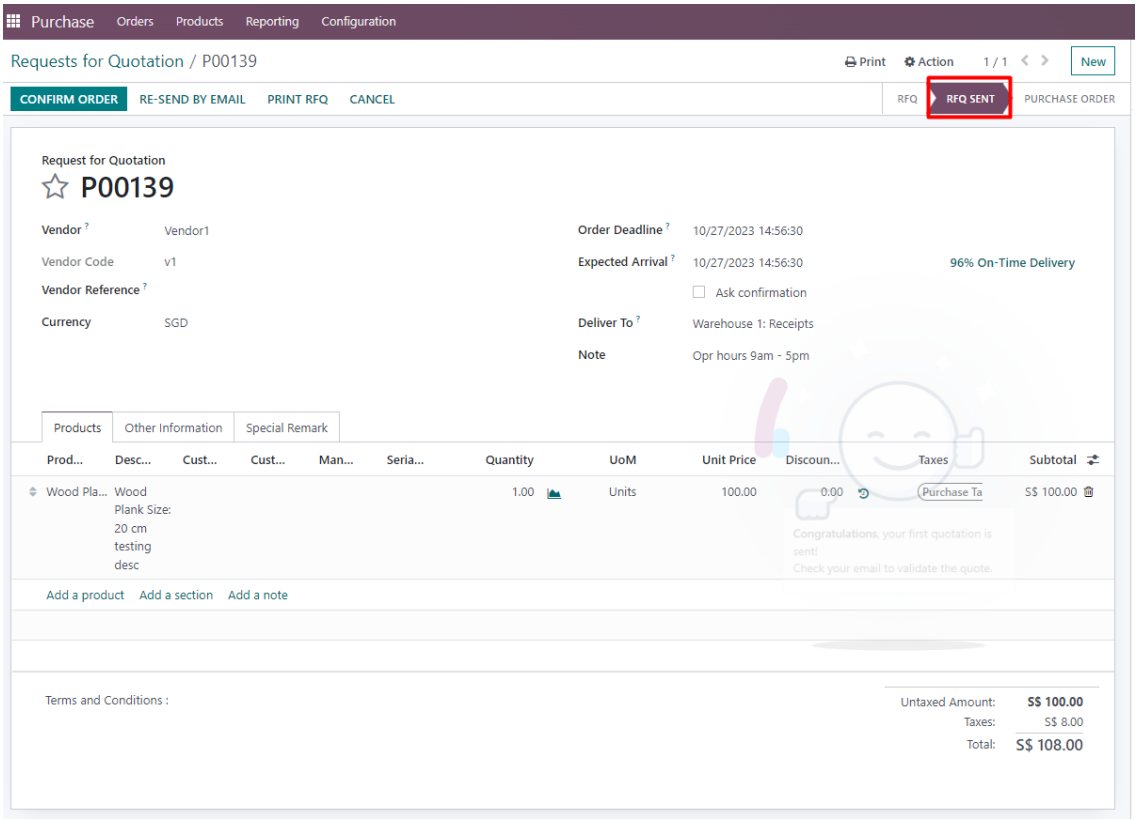




Then you can key in the information, for example, vendor, product, price, etc. If the information is ok, you can send the RFQ to vendor by clicking the Send by Email button. Then the status from RFQ will change to RFQ Sent.

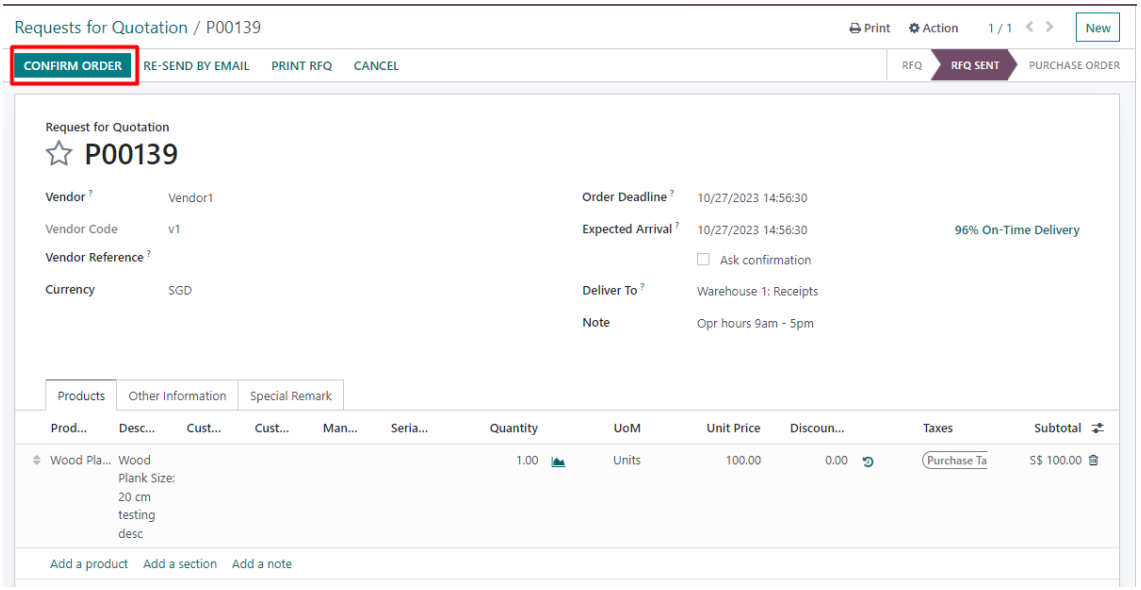


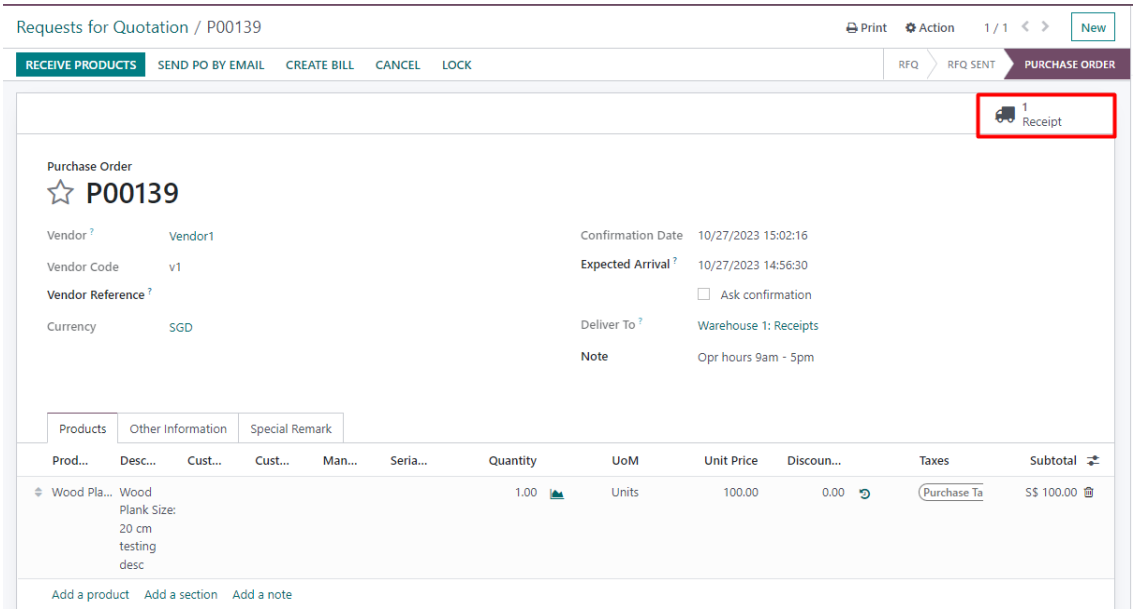




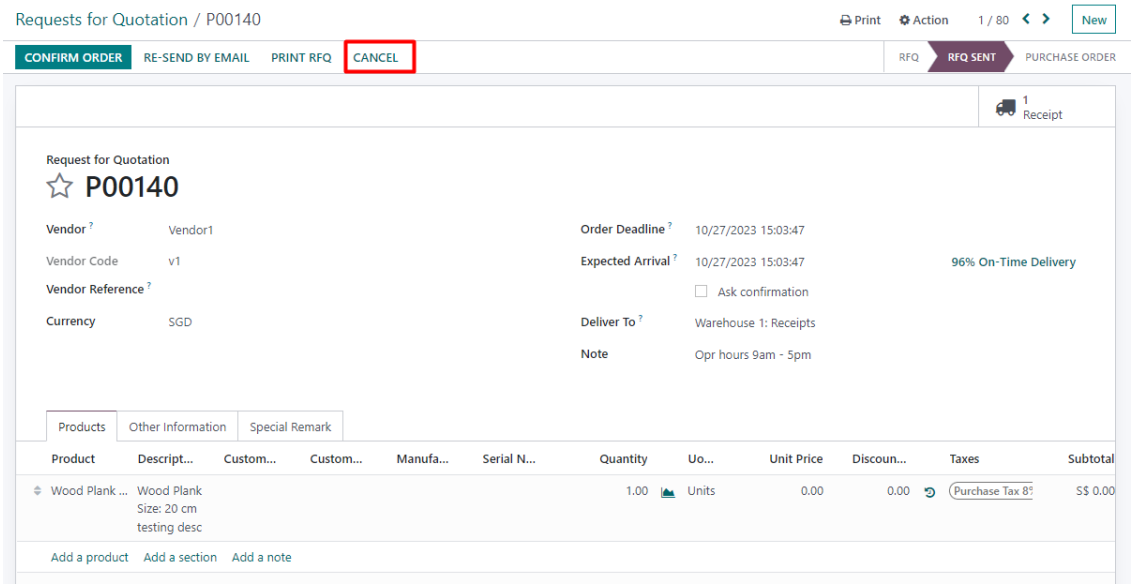
7.2. RFQ Quotation

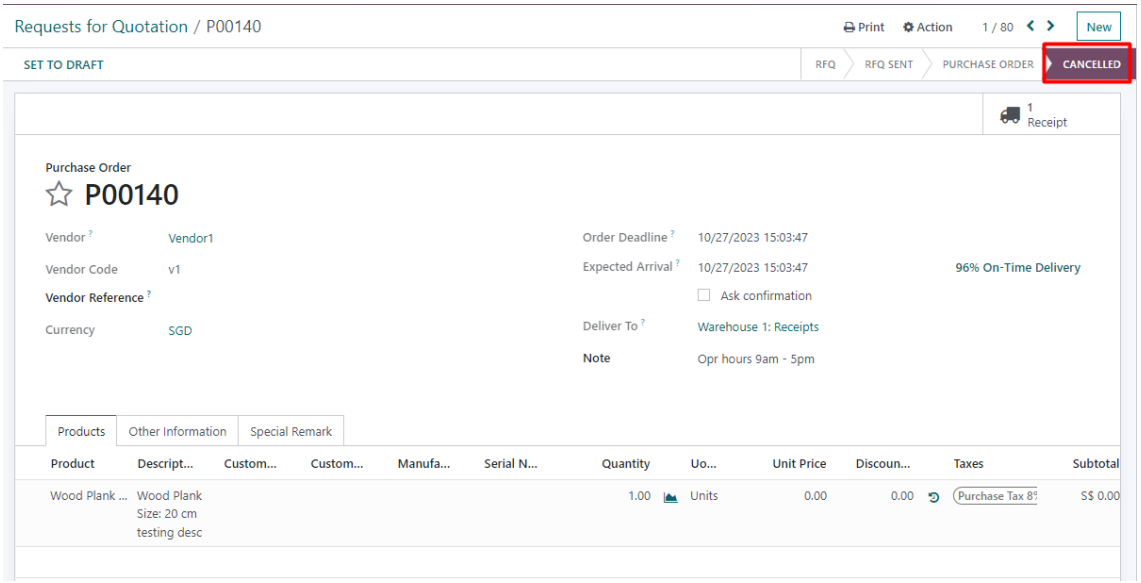
If the RFQ is approved, you can confirm the PO by clicking the confirm order button. The system automatically creates a receipt, and the status will change to Purchase Order.





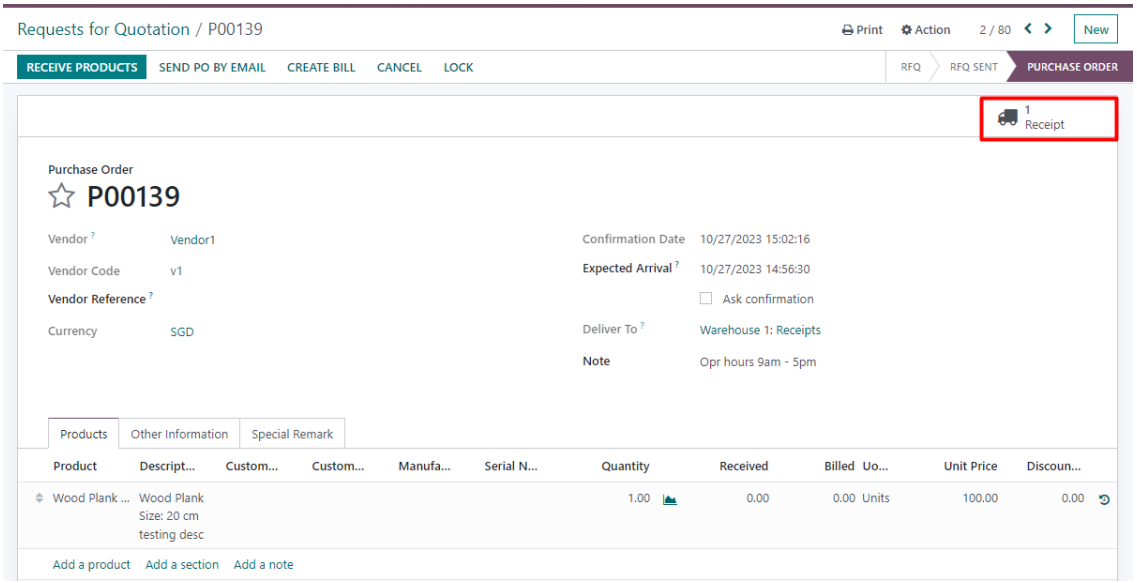
In another case, if the RFQ is not confirmed, you can cancel the RFQ by clicking cancel button and the status will change to “canceled”.

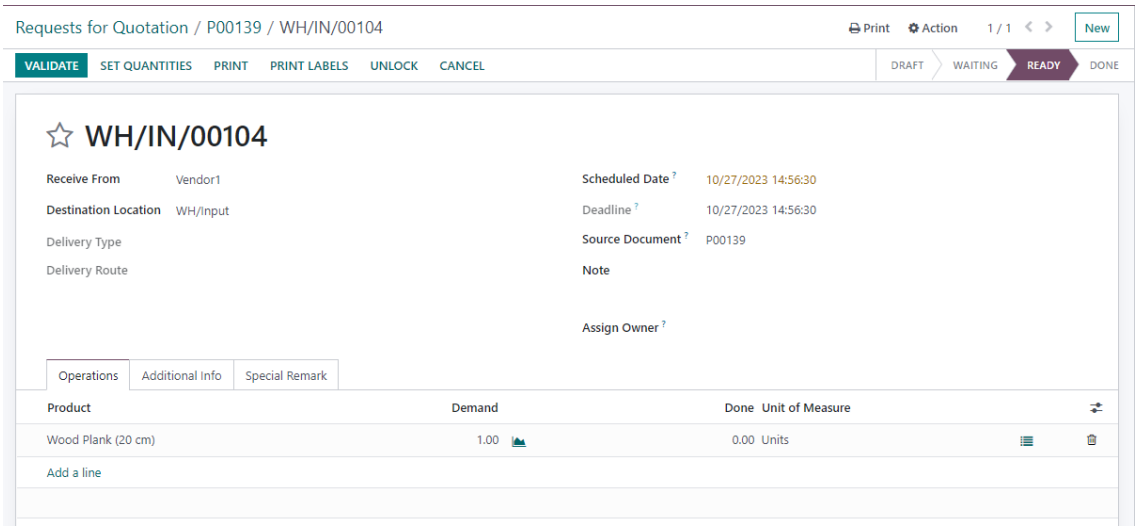




7.3. Receiving Product

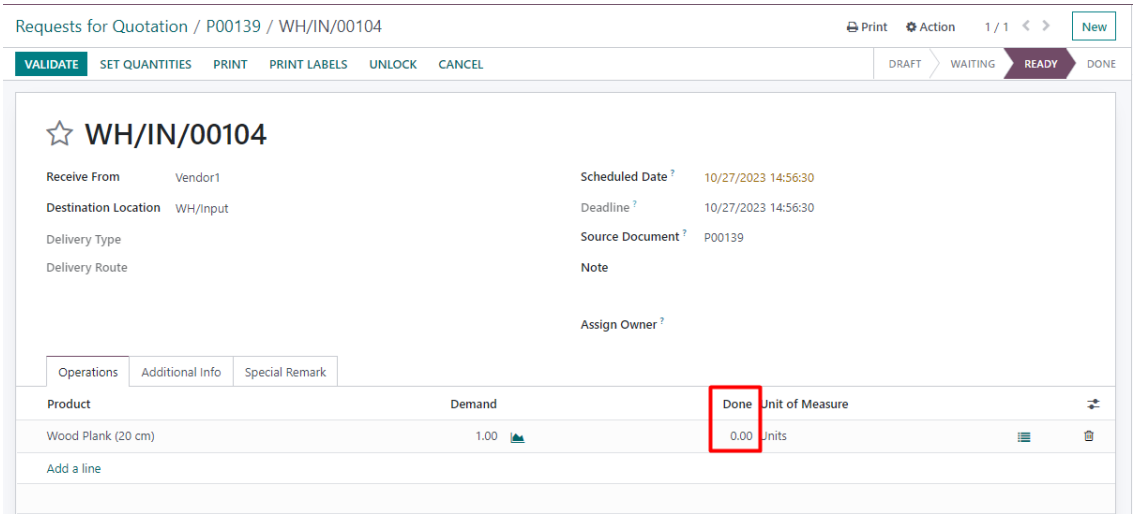
The system will automatically create a receipt on the top right-hand corner of the interface upon confirmation of PO. This smart button will bring you to the inventory receipt function to perform your validation to **receive** said products.

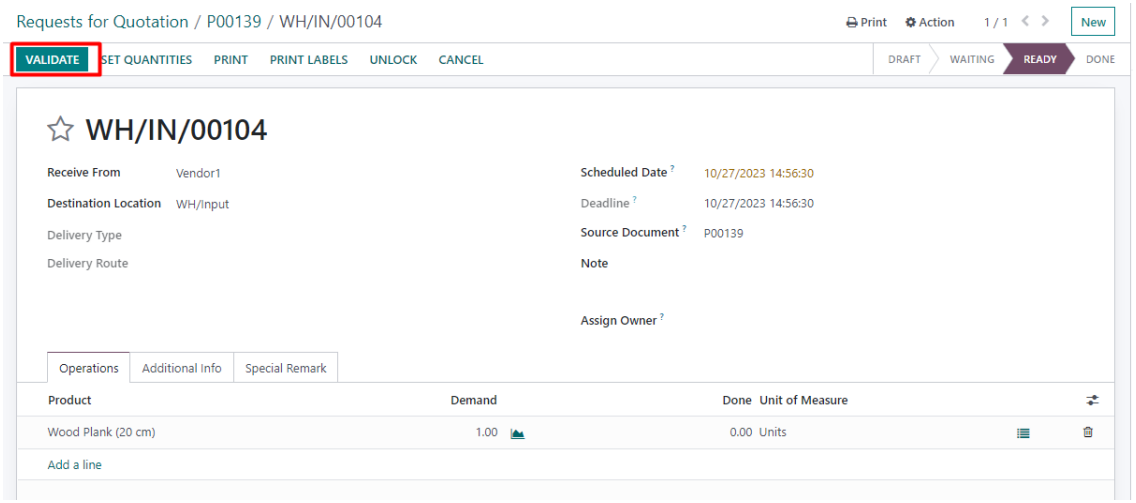




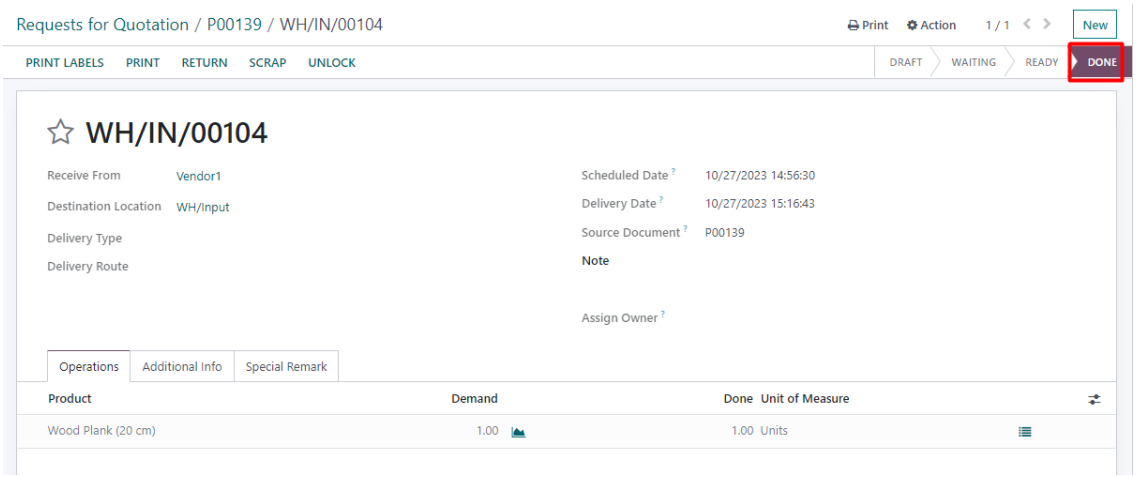
7.4. Checking Approval

In Receipt form you can set the quantity done then click button validate.

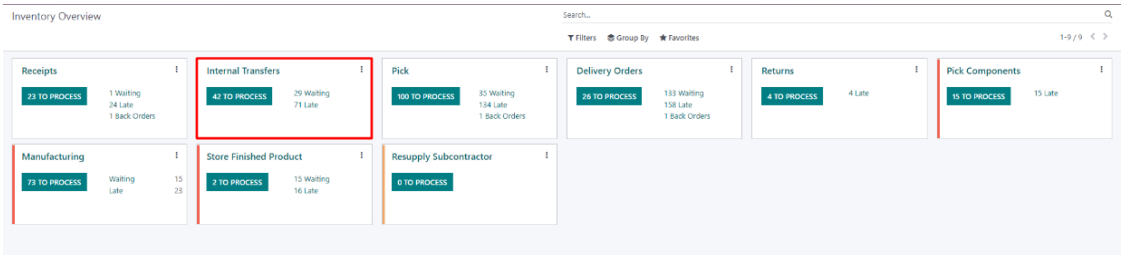




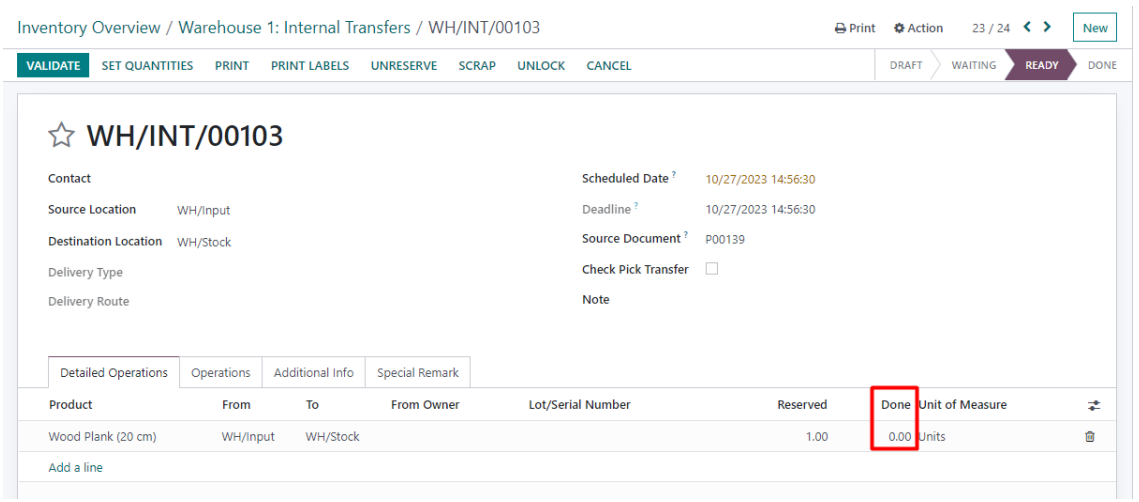
System will change the state from ready to be done.

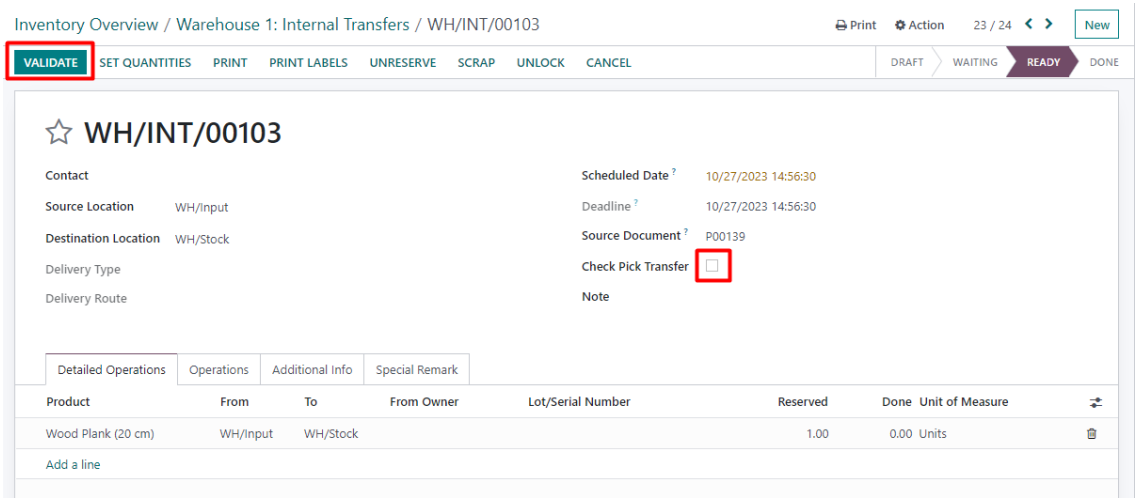


Go to inventory modules. In inventory overview, click internal transfer. Then search the transfer.

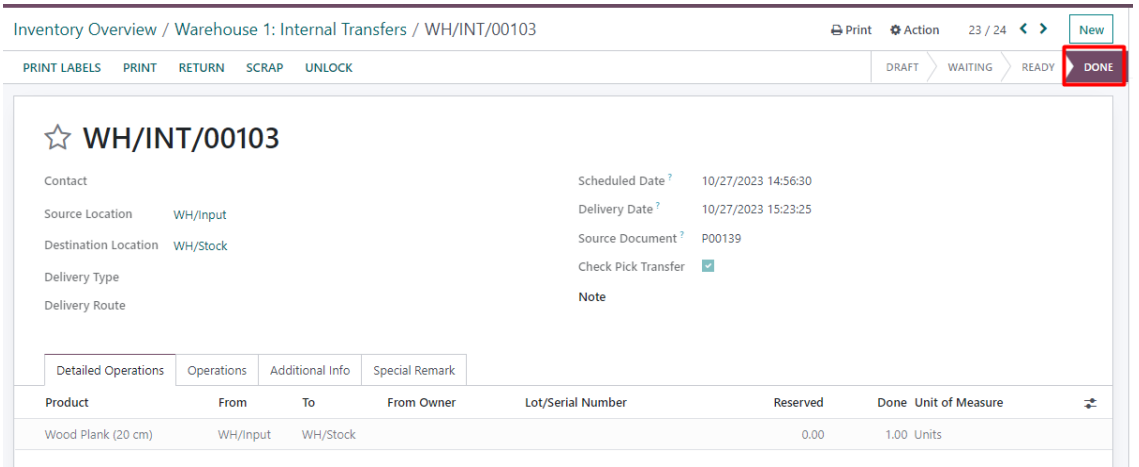


You can set the quantity done and validate the transfer by ticking the check pick transfer box first and click the validate button.



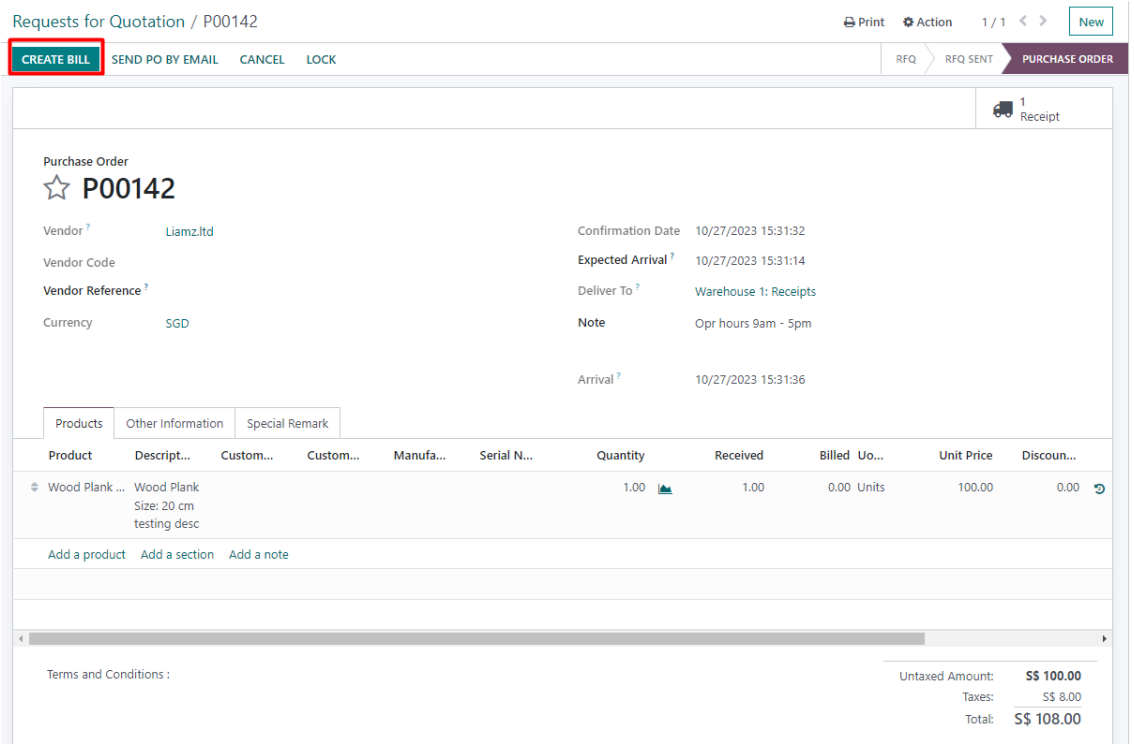


System will automatically change the state from ready to be done.

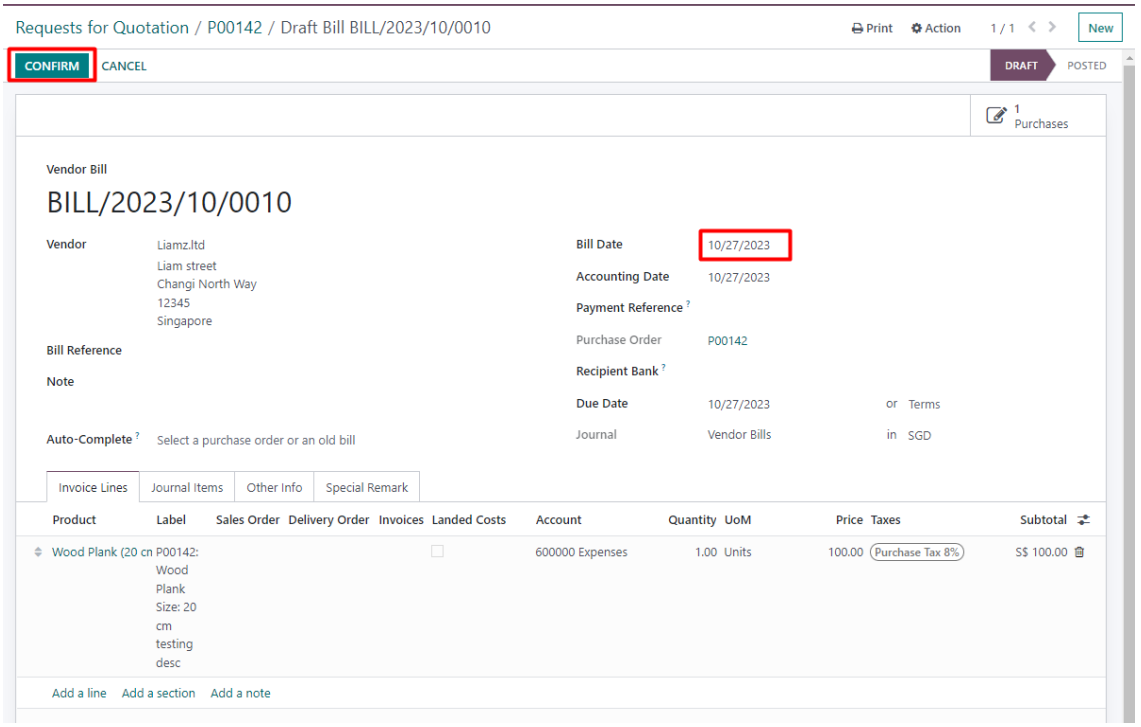


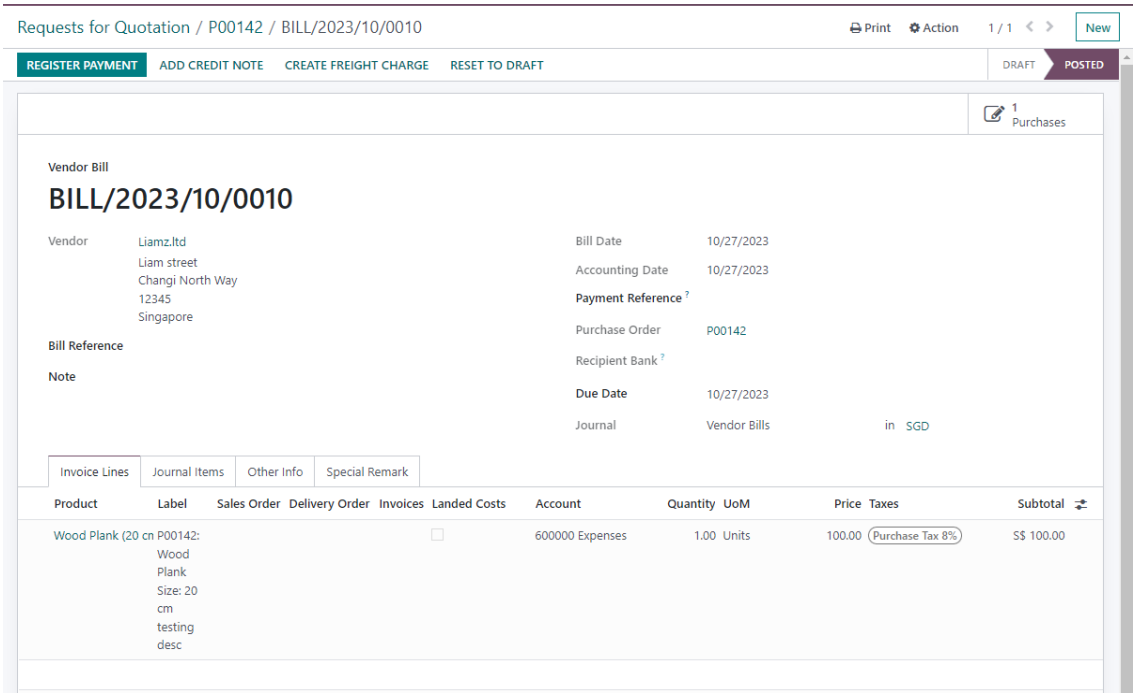
7.5. Create Bills

In Purchase Order Form click button create bill, system will create a draft bill.



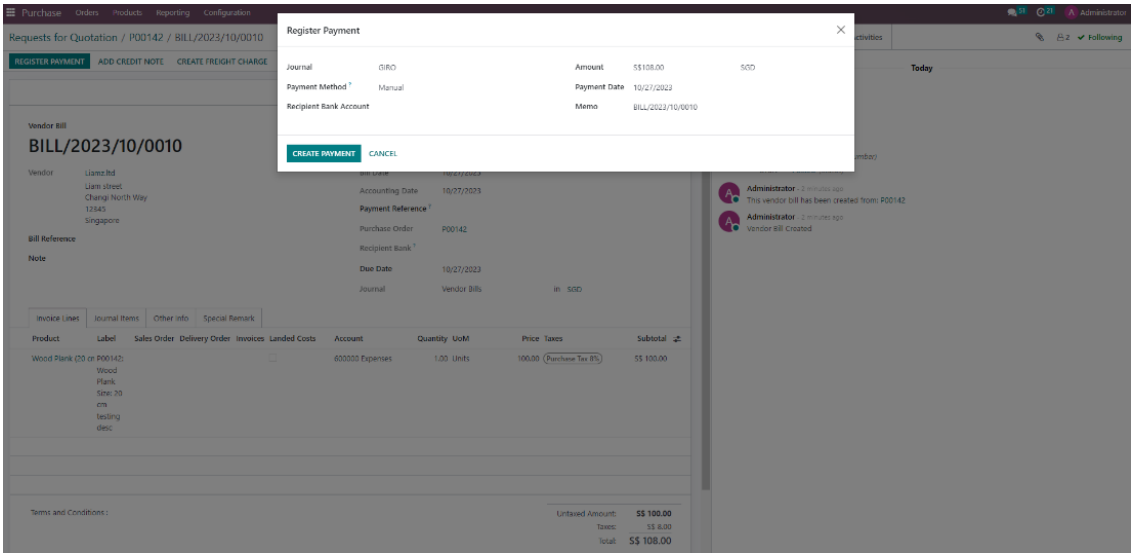
Assign the bill date and click confirm button and state will change from draft to posted.

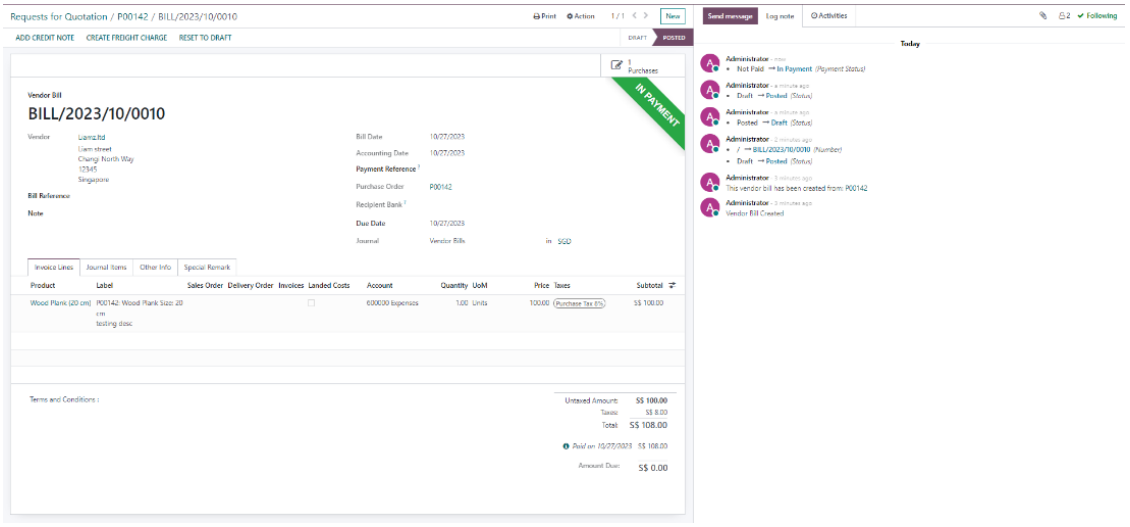




7.6. Create Payment

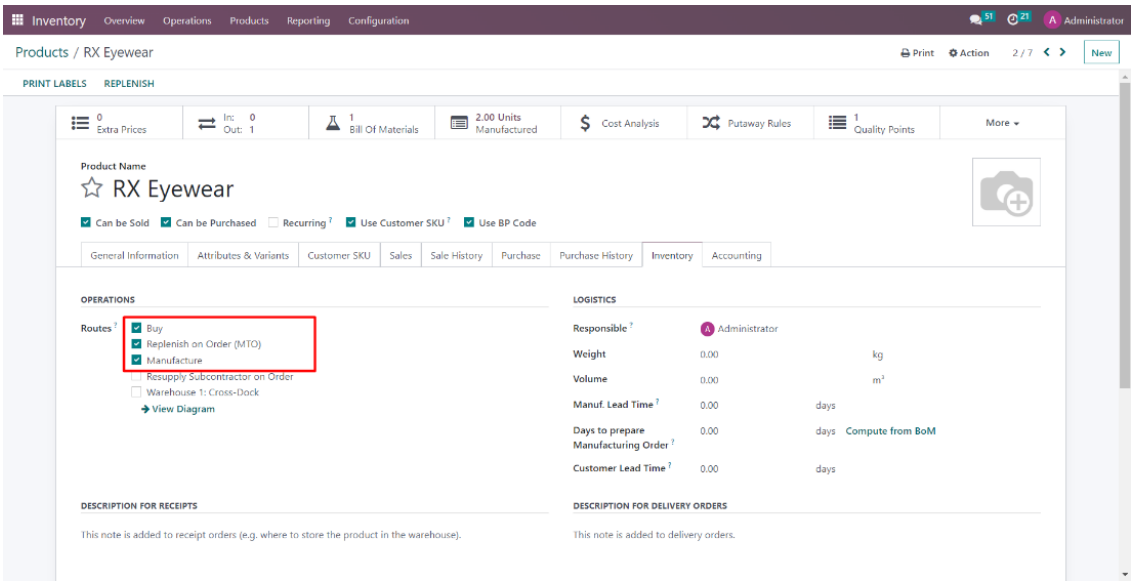
In Bills form, you can click the register payment button to create a payment. The system will automatically show a wizard. Then key in the information. After that, click create payment button.



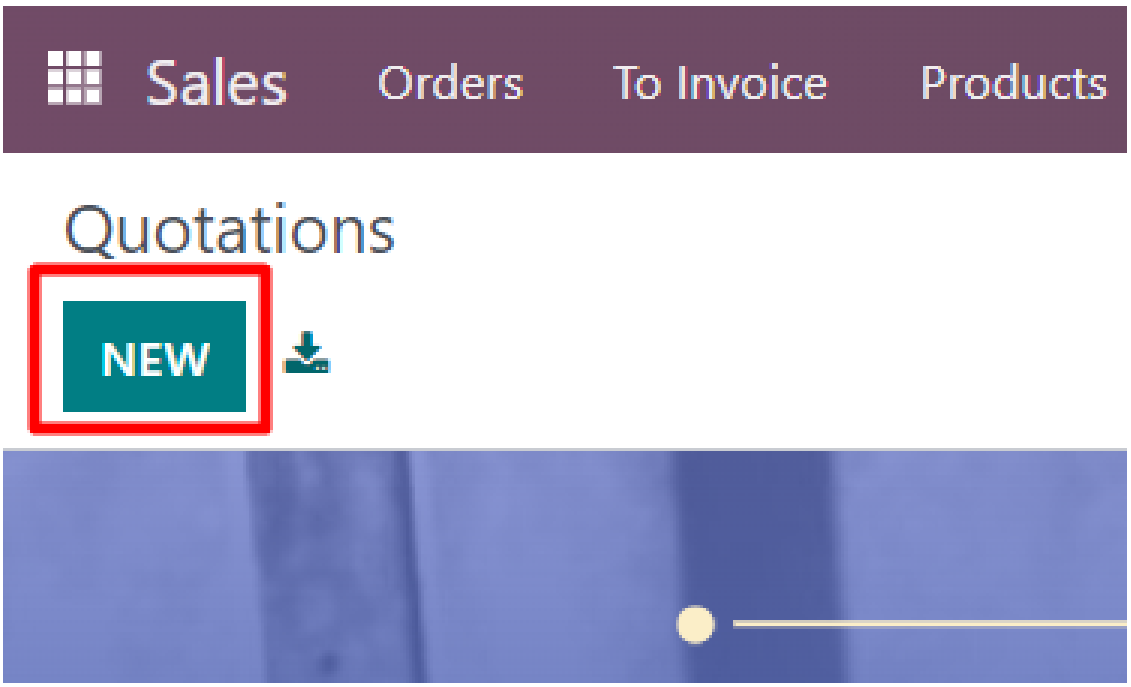


7.7. Purchase from Quotation/Sales

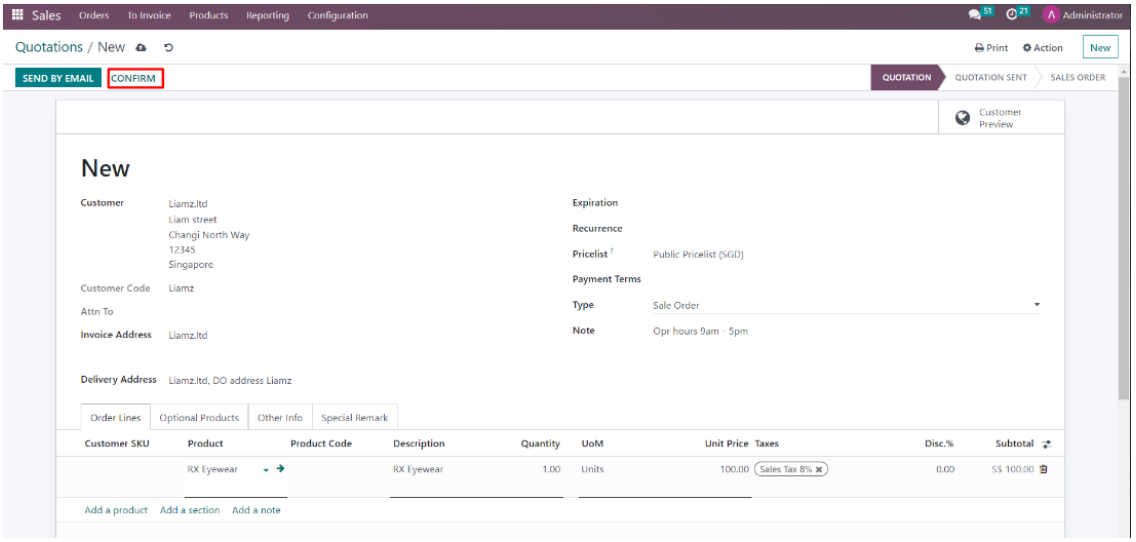
In Product form, you can click inventory tab. Then select Replenishment on order and manufacture



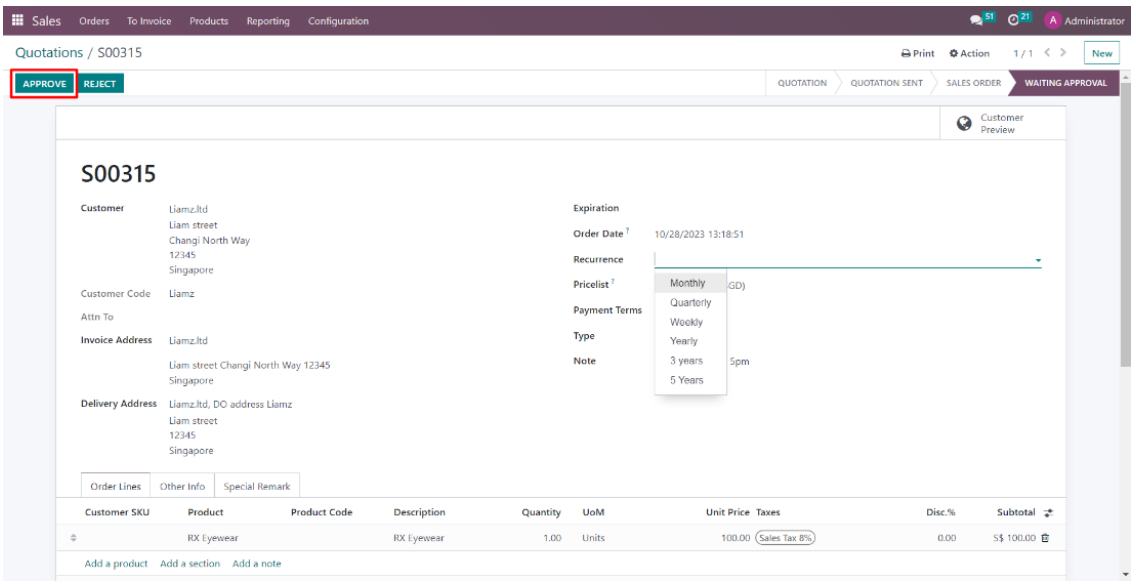
Then go to sales menu and click create button.

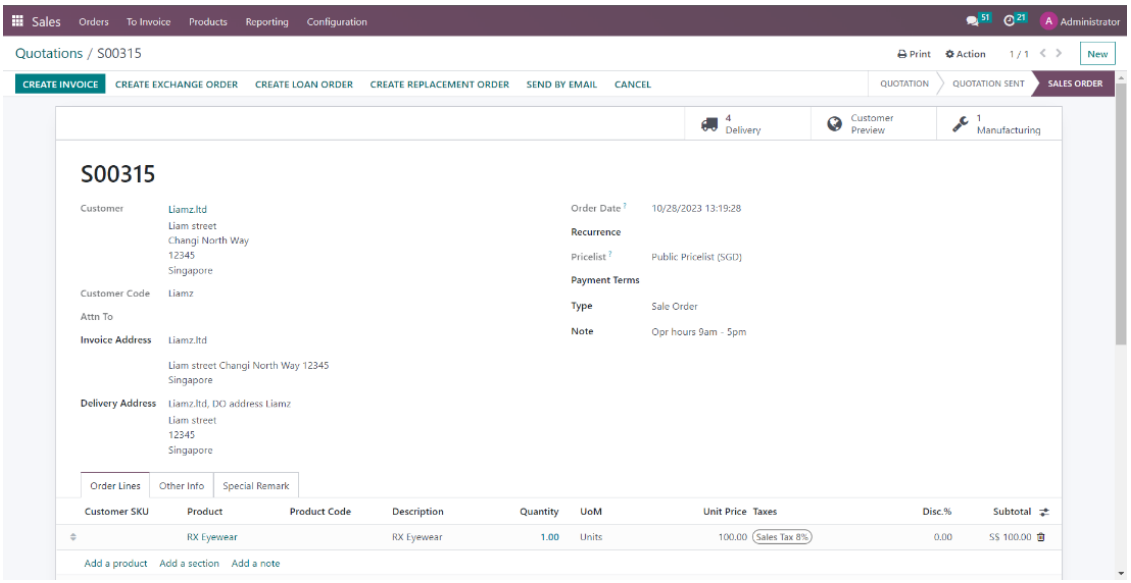


Key in the information and the product. After that , click confirm button.

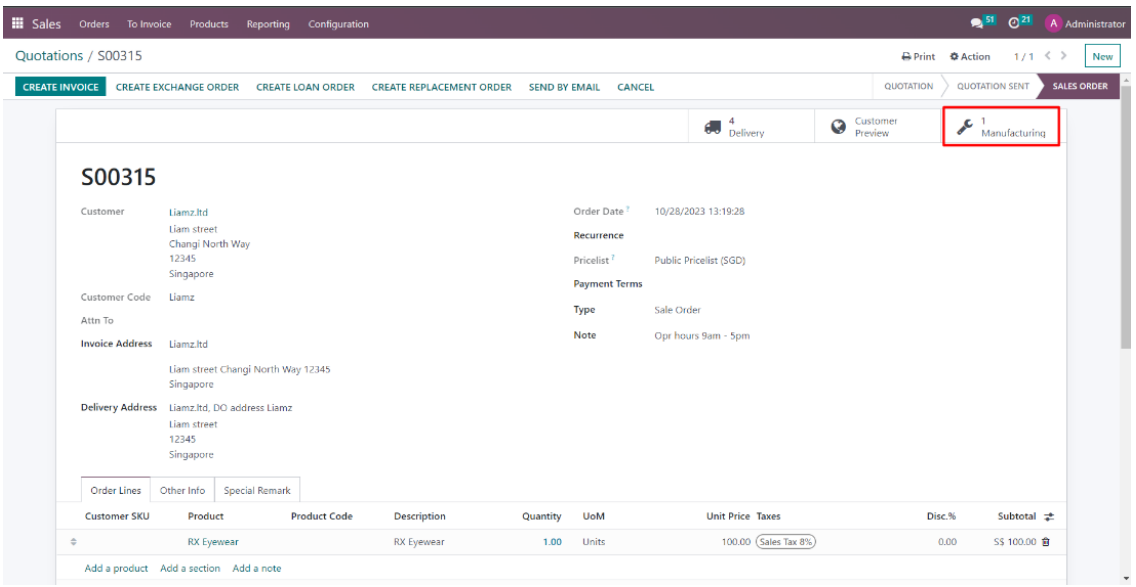


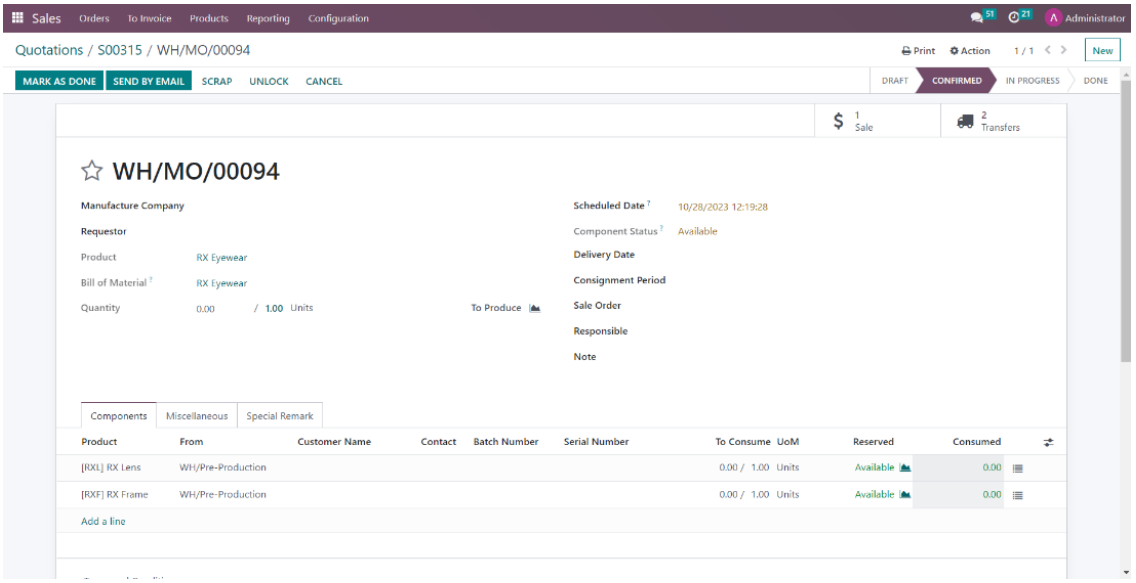
Wait for the approver to approve the quotation, once approved the quotation will turn into a sale order





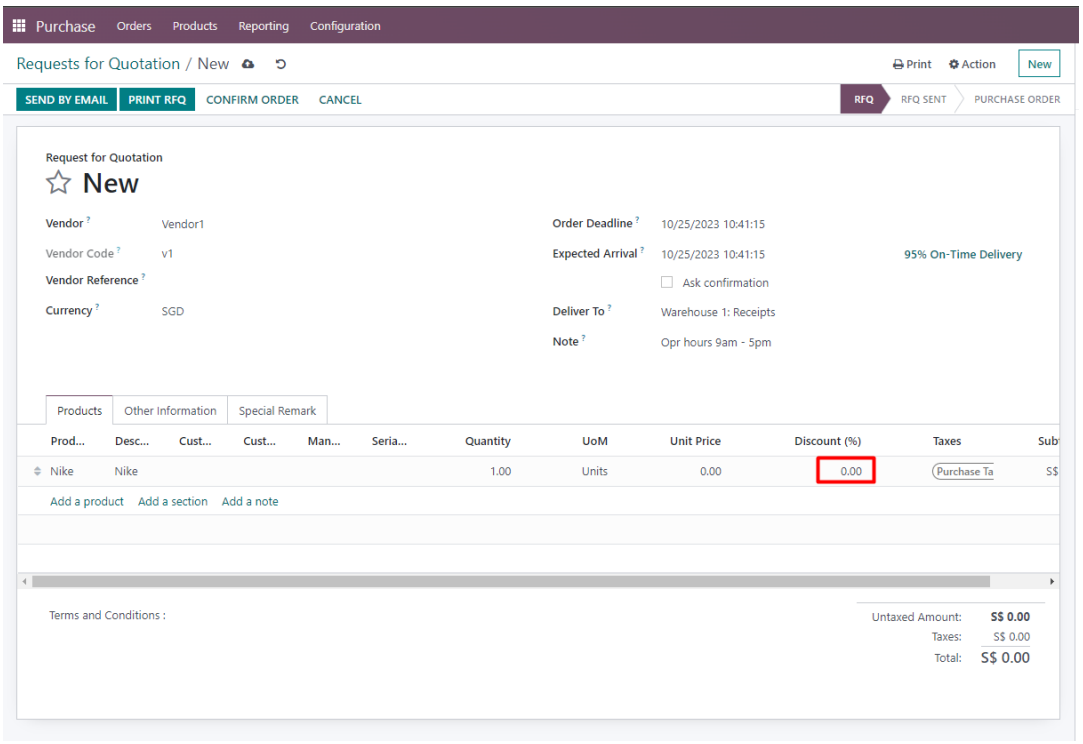
The system will create a manufacturing order. You can click the smart button to see the details.





7.8 Purchase discount

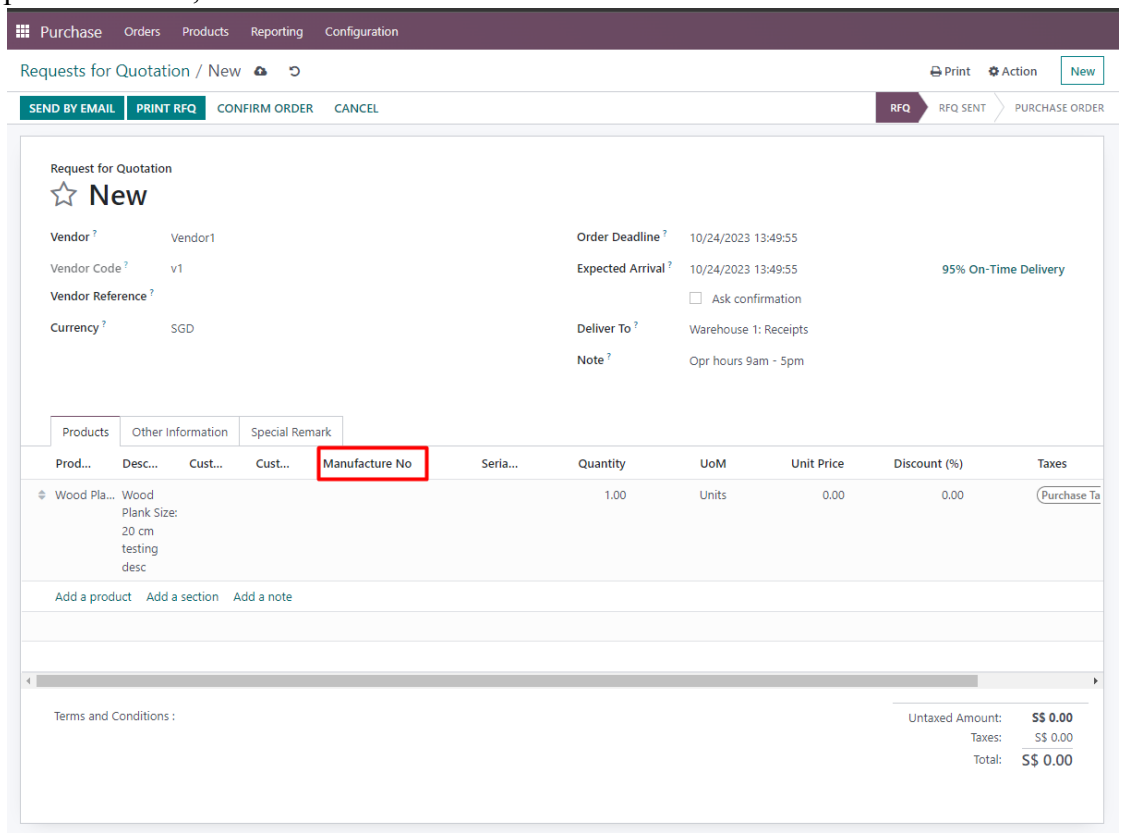
In purchase module, create a new rfq and assign the purchase discount in the field



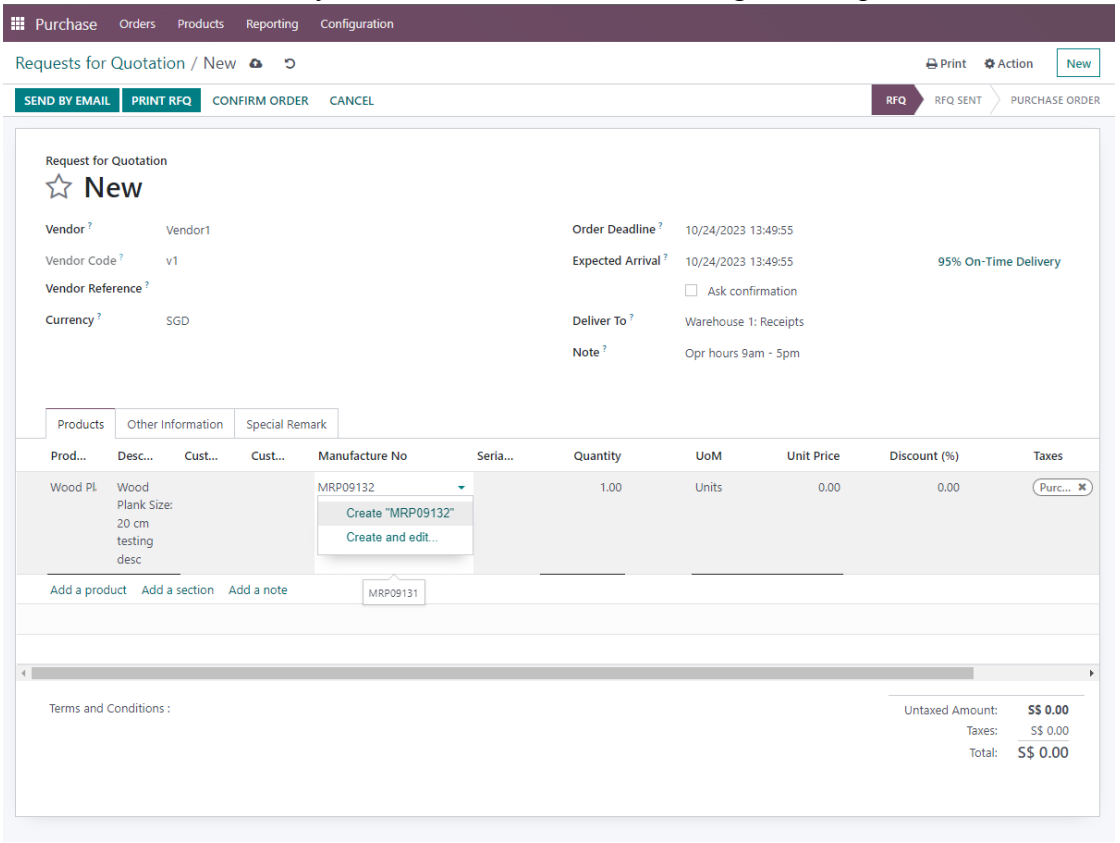
On the purchase order you want to add discount to , key in the discount in this field and the system will automatically calculate the price for you

7.9. Assign a manufacture number

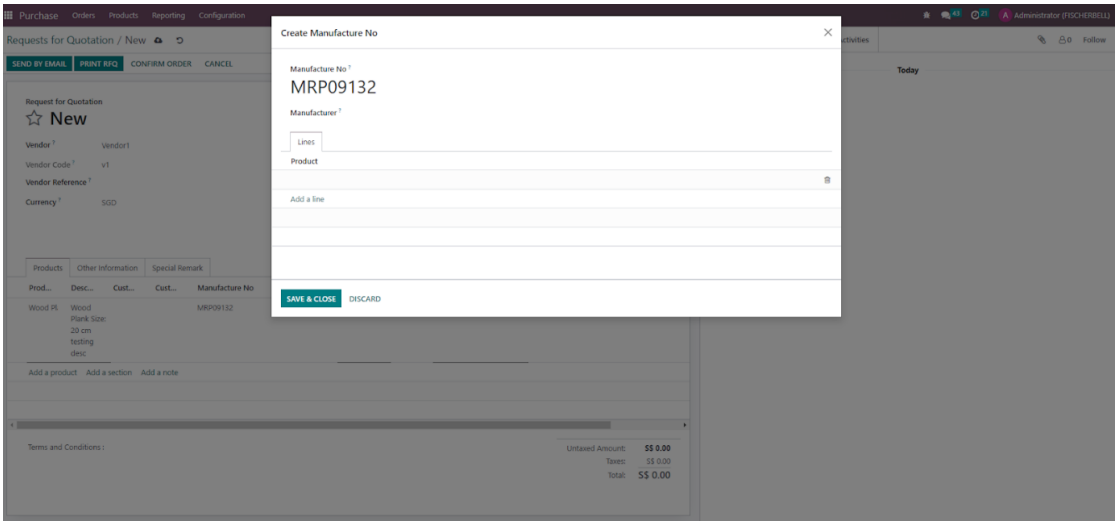
to assign a manufacture number we need to go to the purchase module > Create a new purchase order, and in the order line there is a manufacturer no field



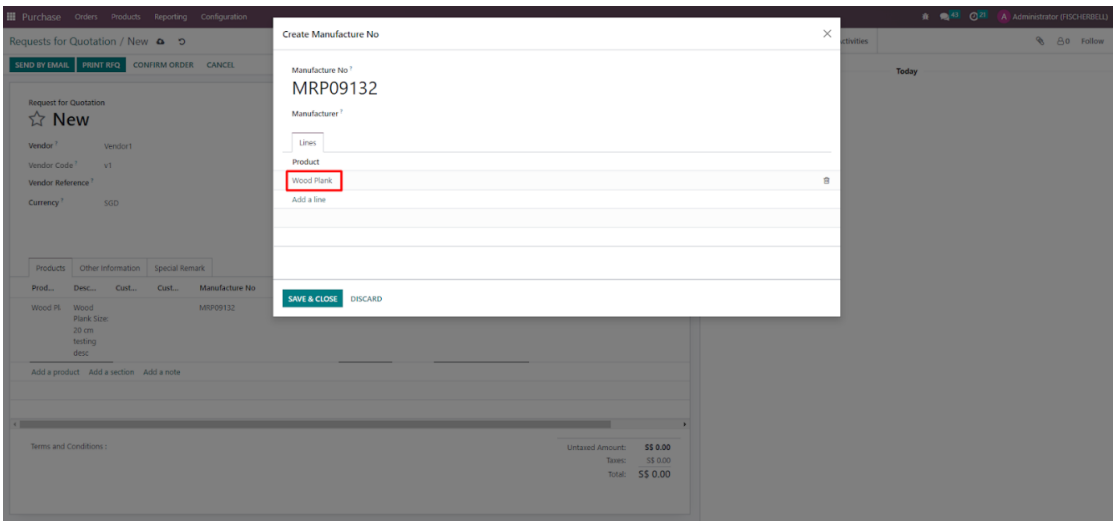
Click on the field and key in a manufacturer no to be assign on the product



Click on create and edit, there will be a popup allowing you to assign multiple product with the same manufacturer no

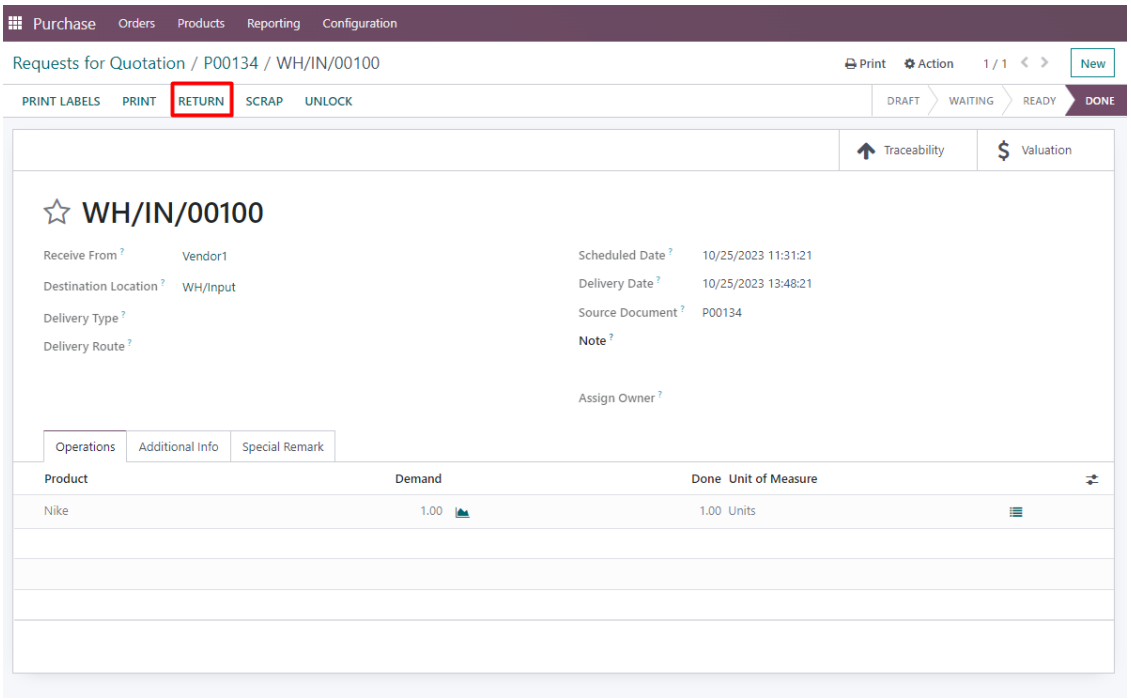


Click on add a line and search for your product

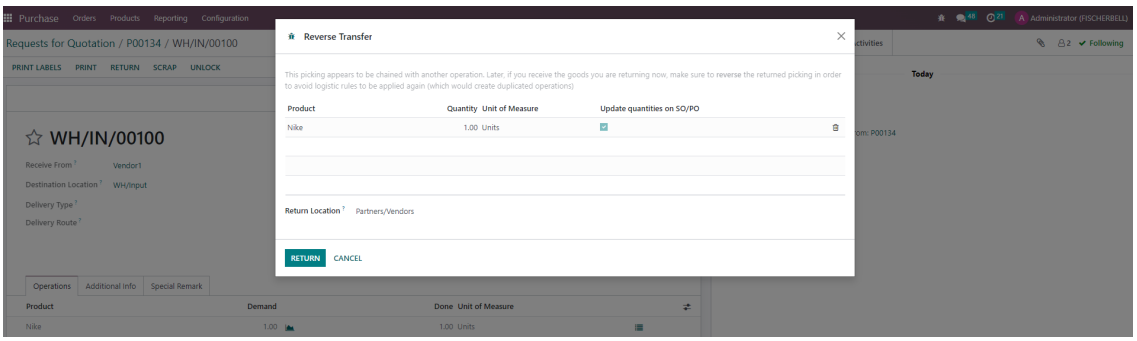


7.10. Purchase return

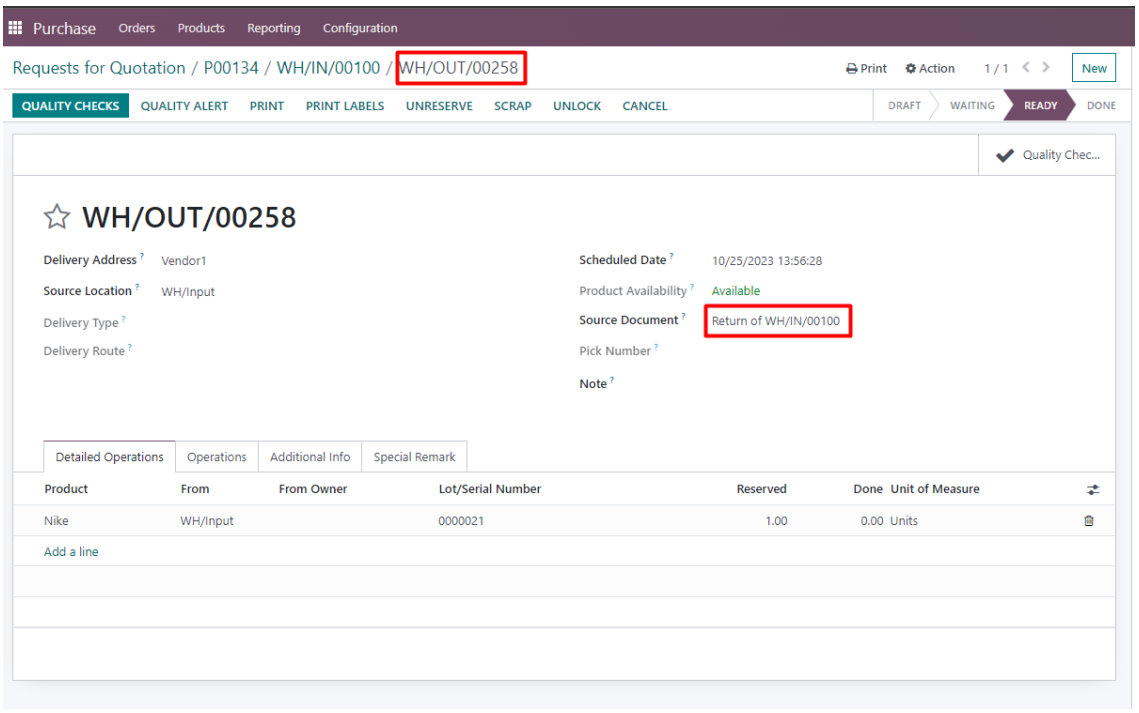
In Purchase and in one of the selected receipt that has been validated, click on return button

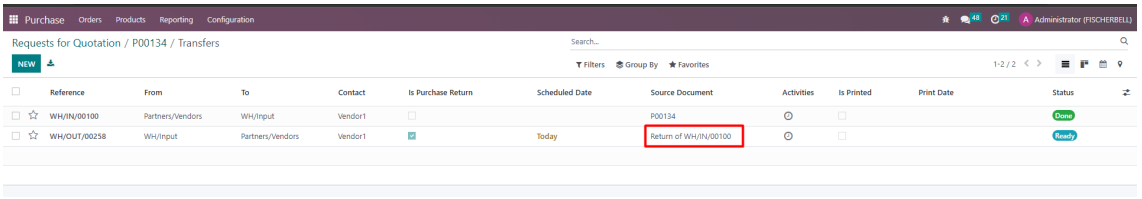


Once you click on return you will see a pop up where you can set the product, quantity, and the return location



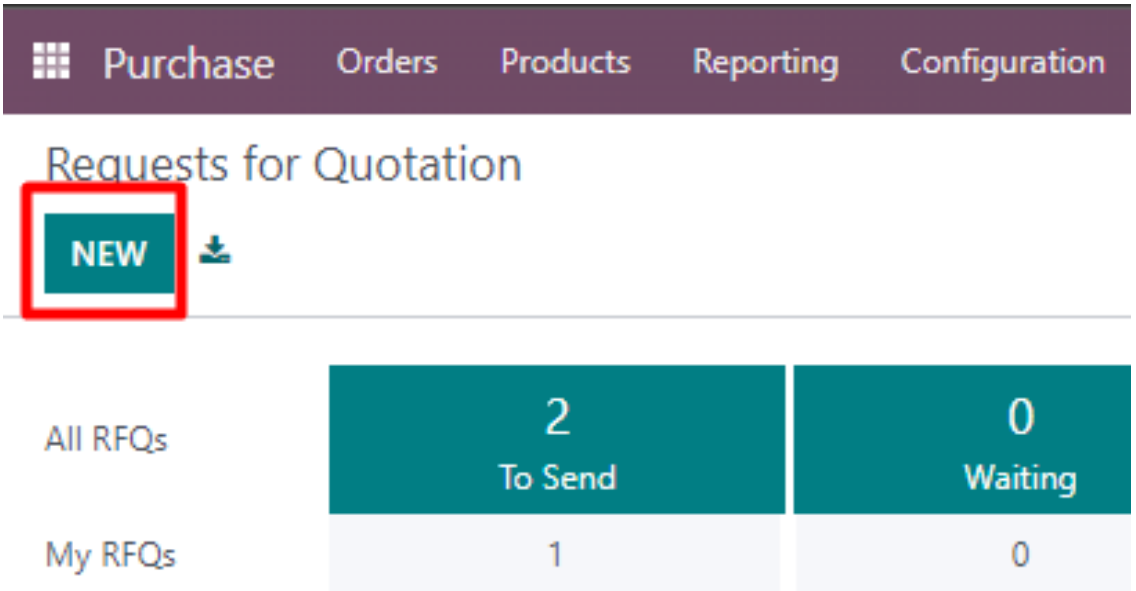
Once you've set the correct information for it click validate and the system will automatically create it for you



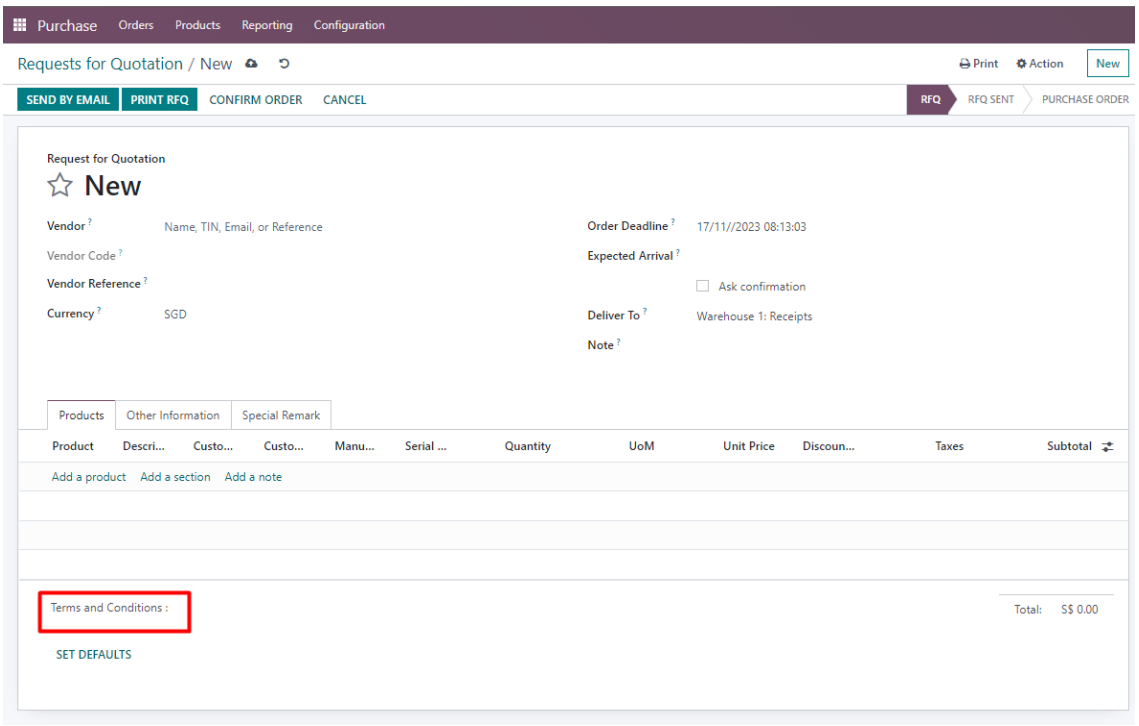


7.11 Terms and condition in PO

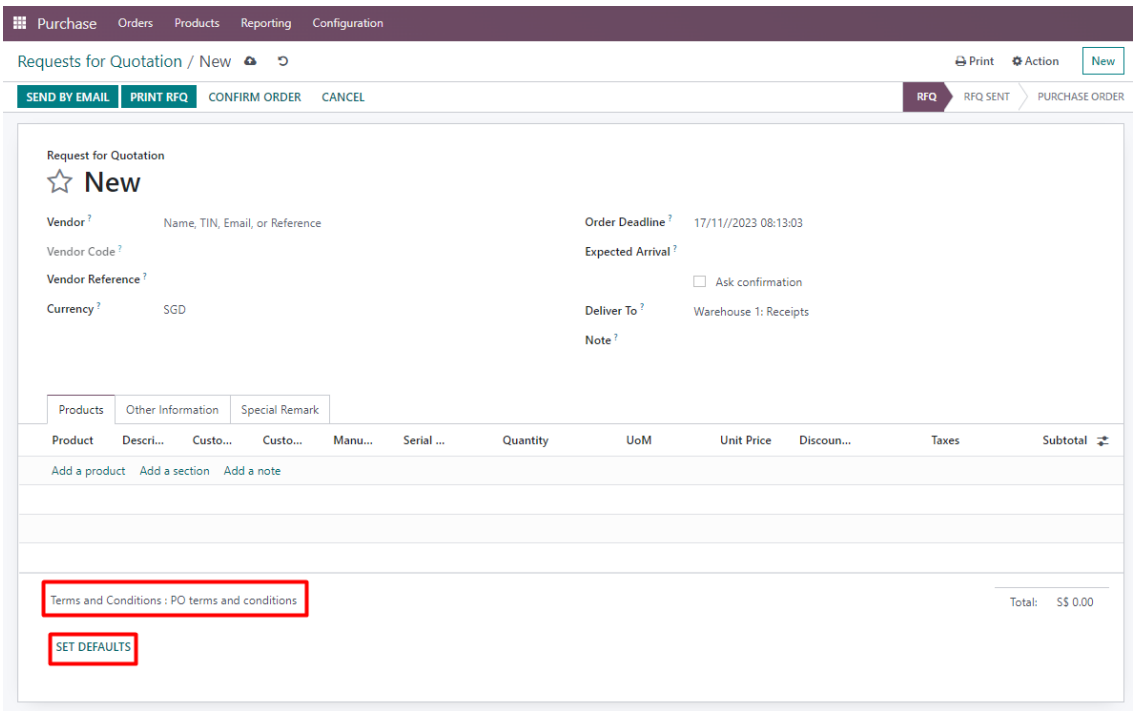
In the main dashboard go to the purchase module and create a new quotation



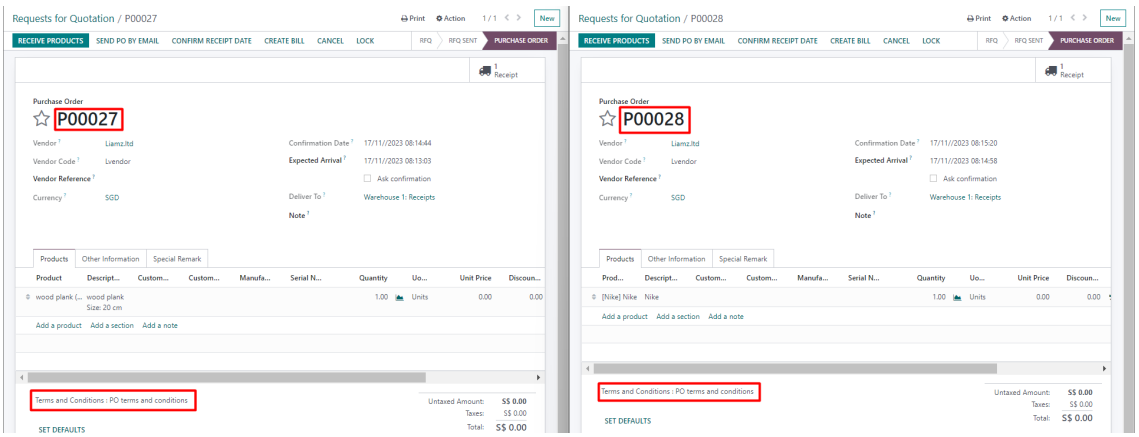
Under the order line we can see a field for terms and condition



Key in the terms and condition for the PO and click on the set it as default



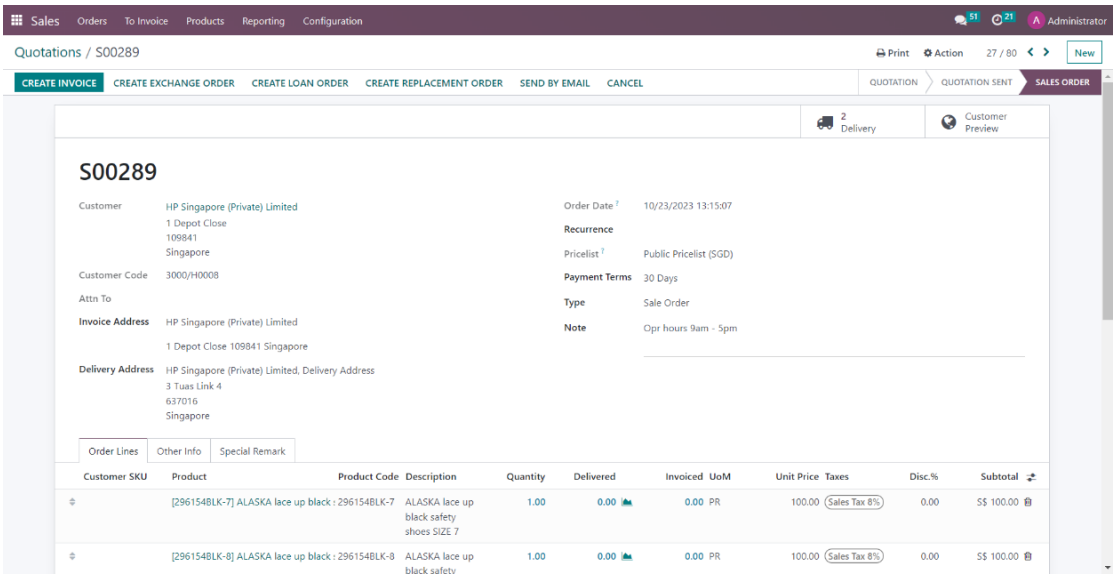
After you click on set as default the next PO and so on will be using that terms and condition



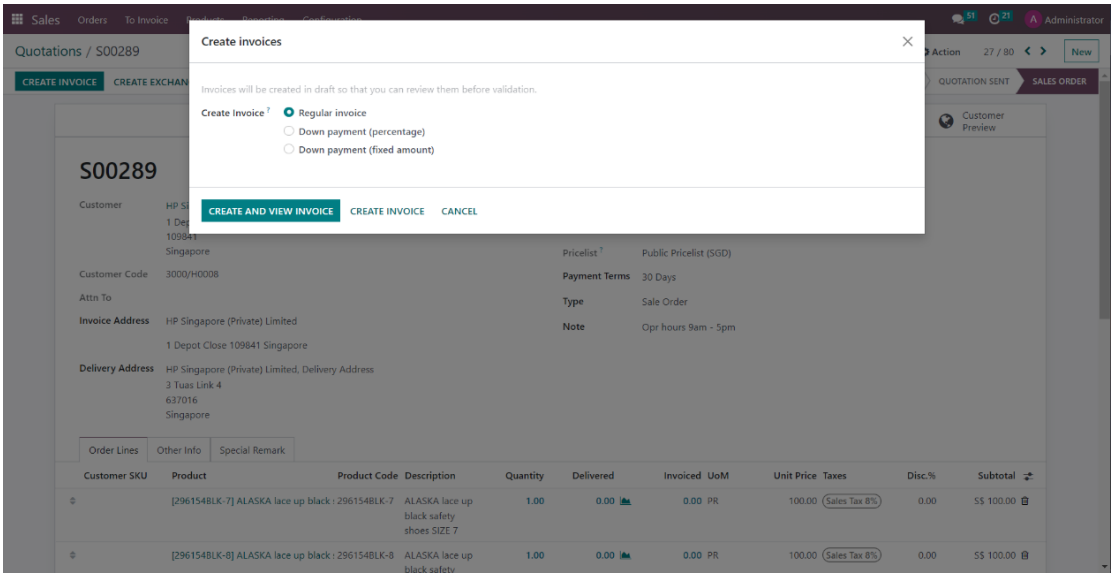
Note : if there is a special case where you will only use a terms and condition one time, you can key in the terms and condition and not click on the set as default button, it will not change the default terms and condition for PO and will also reflect in the printout

8. Accounting

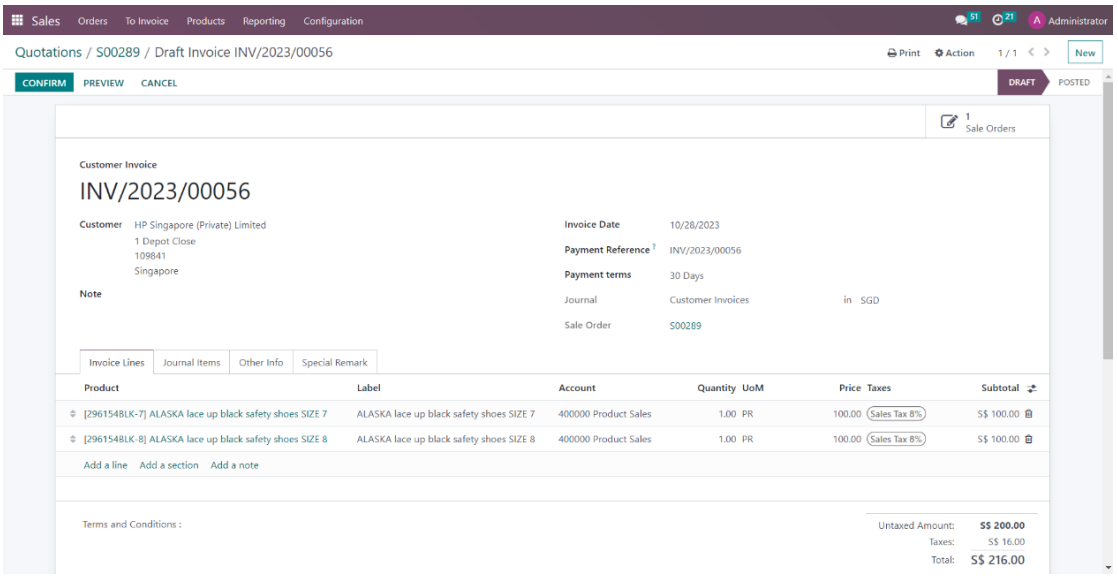
8.1. Invoice



To create an Invoice from the Sales that we have made, we can go back to the Sales and from Sales, we can click the Create Invoice Button

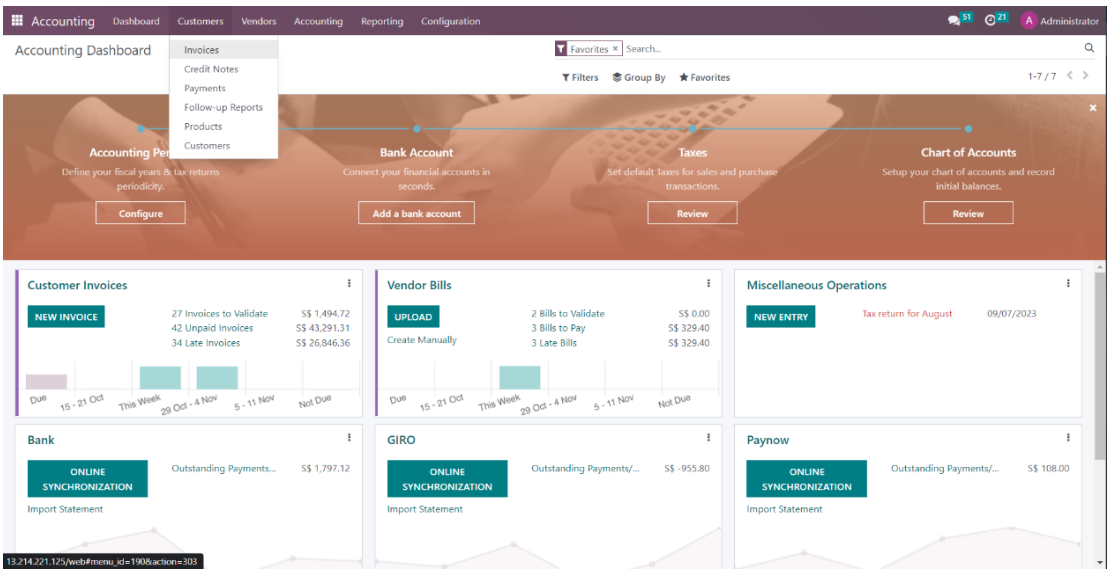


On Click a Pop-up will show and for the Invoice, you can choose between Regular Invoice, Down Payment Percentage/Fixed Amount. For this example, we will just go with the Regular Invoice. Then we can Click the Create and View Invoice to automatically redirect us to the Invoice that the system will create

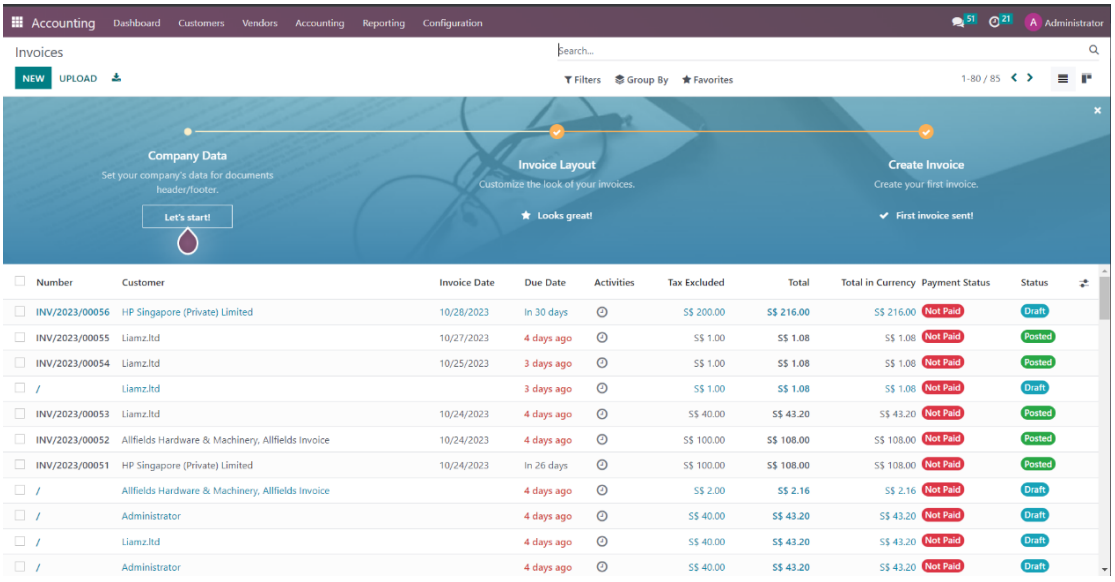


After automatically redirecting to the Invoice Form, we can just click the Confirm button.

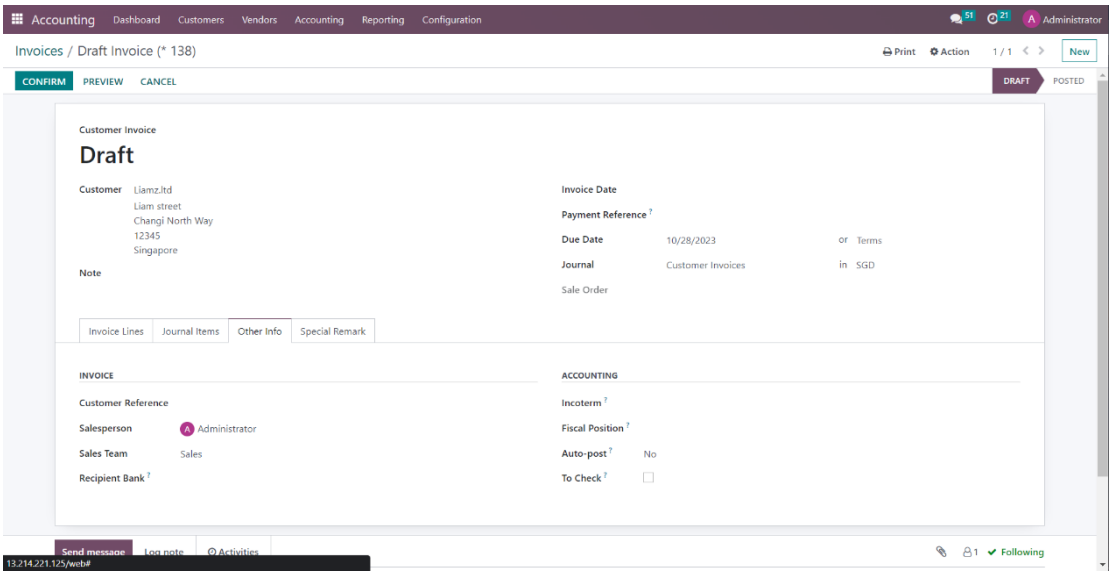
We can also create an Invoice without the need for Sales, for this we can go to the Main Dashboard Then we can click the Accounting Module.



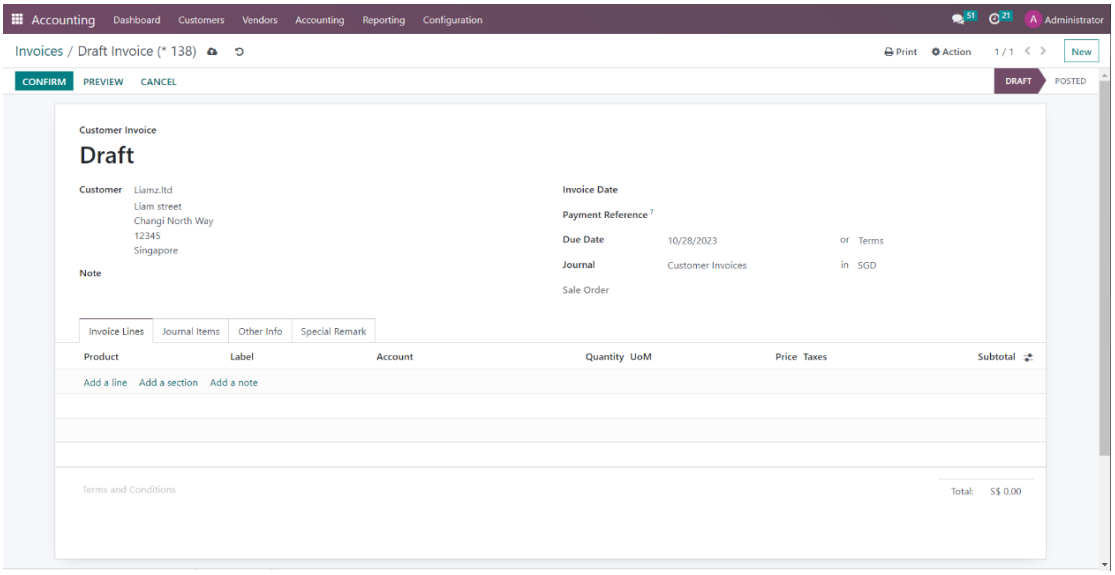
From here we can click the Menu Customer, then click Invoices



Right here we can see all the Invoices, we can then click the Create Button.

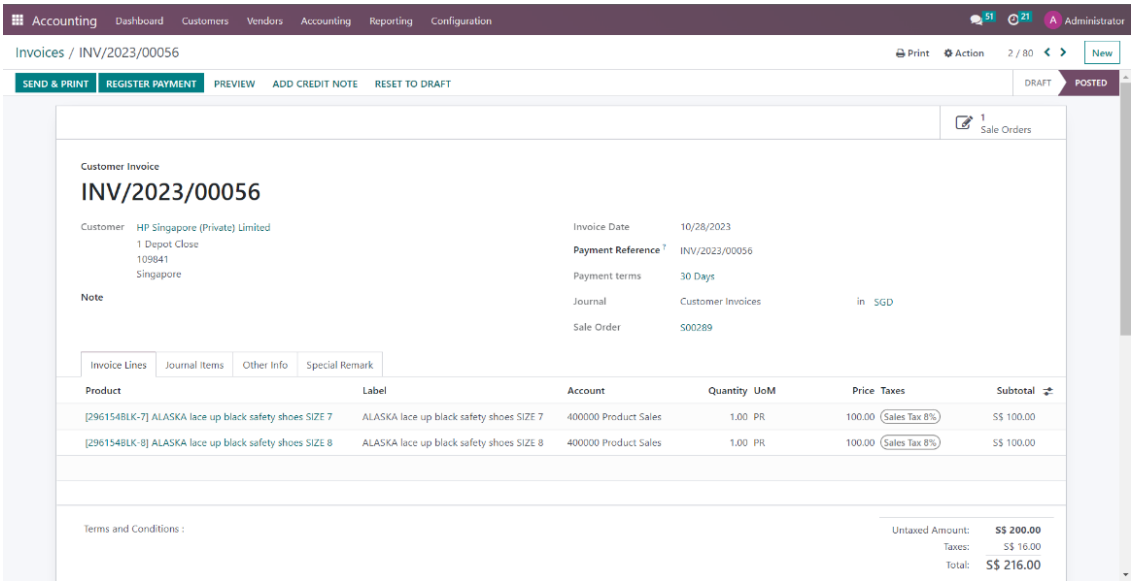


After that, we can input all the details and can check the Other Info tab to see other details.

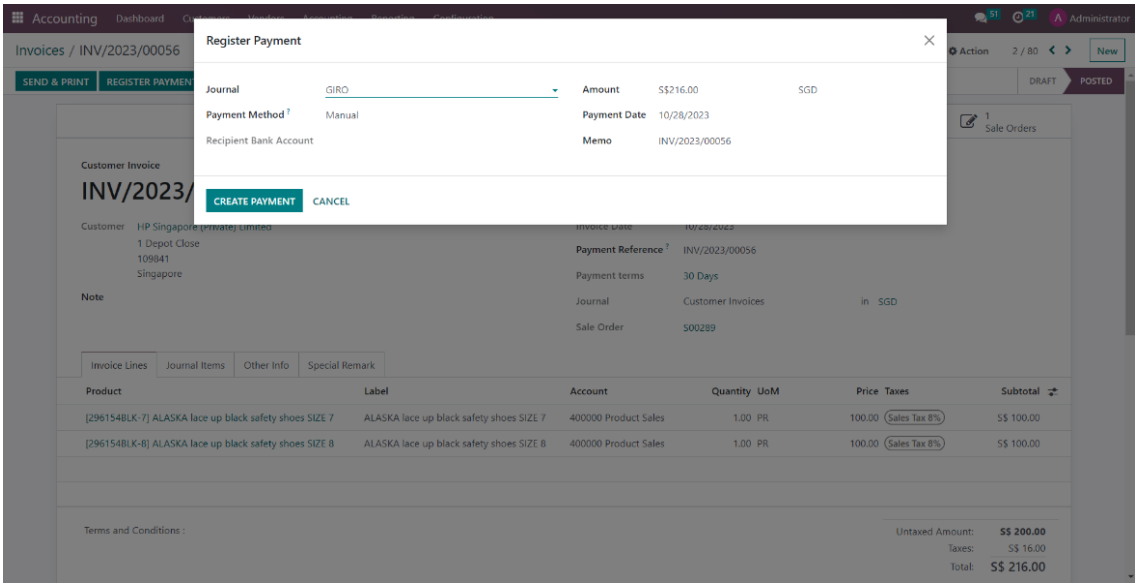


Then we can input all the product on the Invoice Line tab

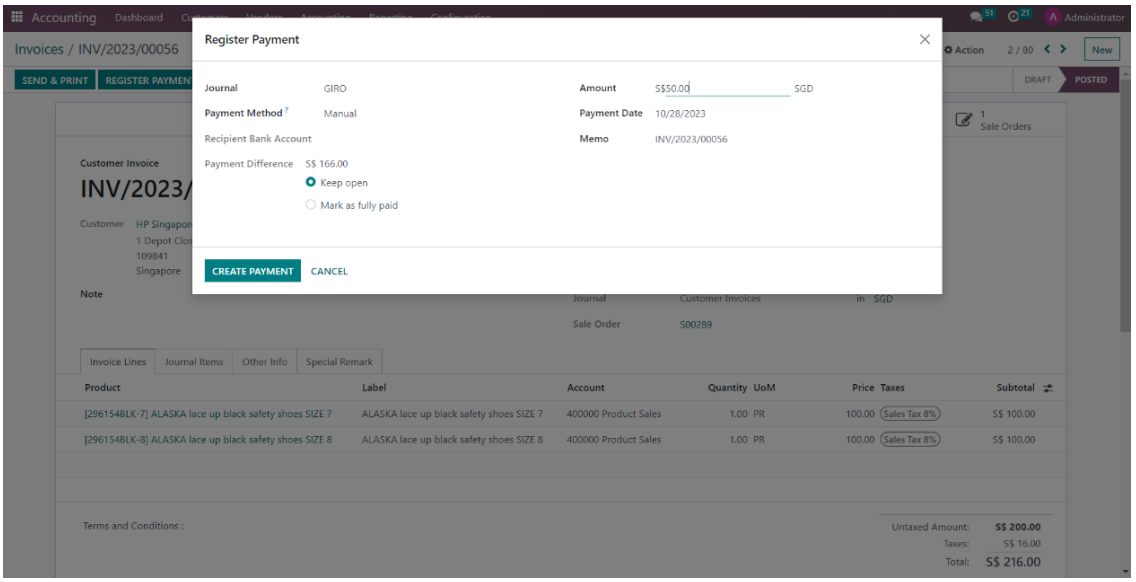
8.2. Invoice Register Payment



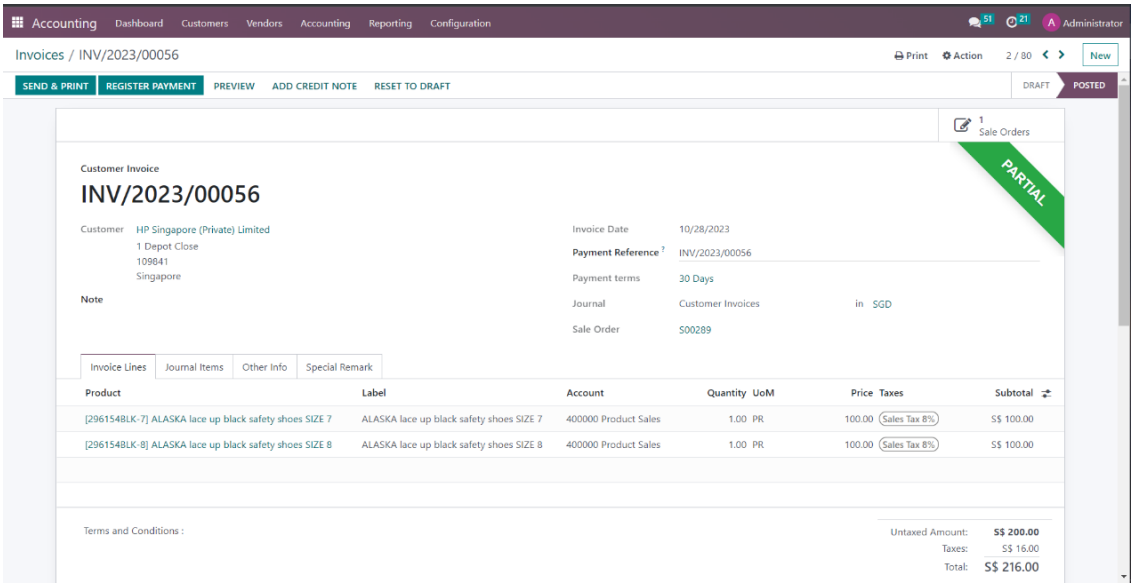
Then for Customer to pay the Invoice we can click the Register Payment



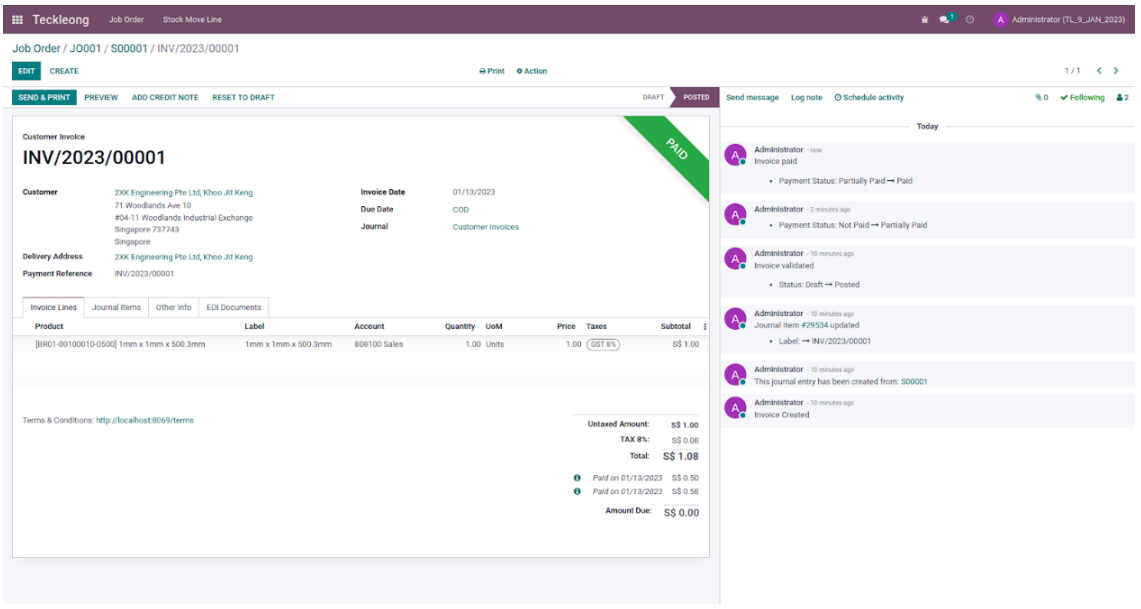
A Pop-up then will show and by the system default will set the Amount to be fully paid but you can edit this manually. You can also change the other details such as the Journal, Recipient Bank, and Payment Date



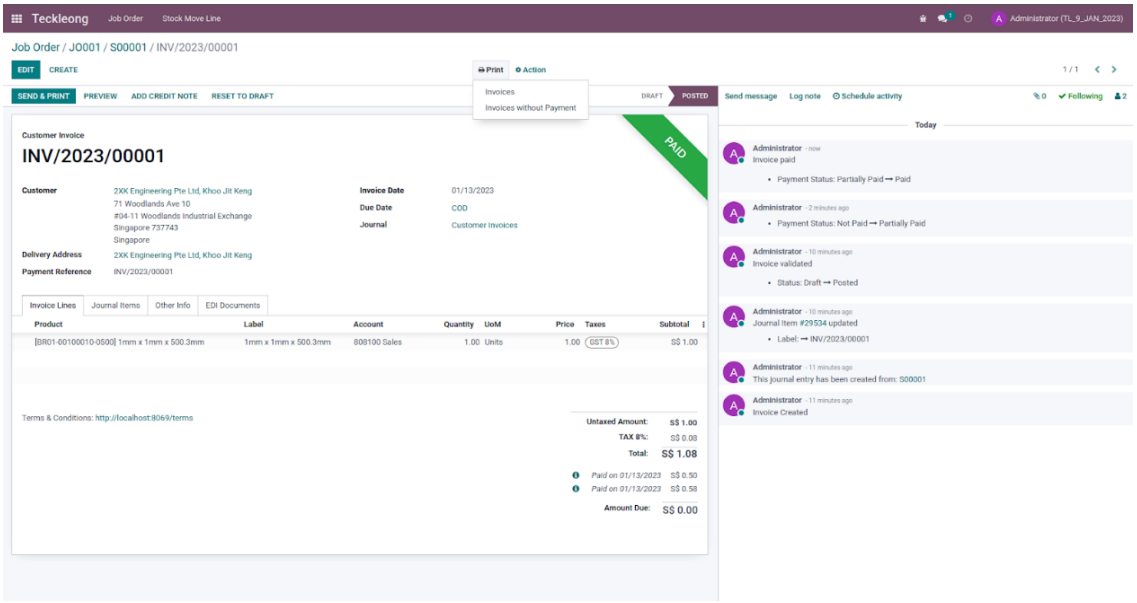
For example, if we don't put in the fully paid amount then a selection will show either we wanted to Keep the Invoice Open or mark the Invoice as Fully Paid.



If the Customer is not paid fully and we set the Invoice to Keep Open then you can see the Green Ribbon Partial marking this Invoice is still Partially Paid and we can still Click on the Register Payment to change the Partially Paid

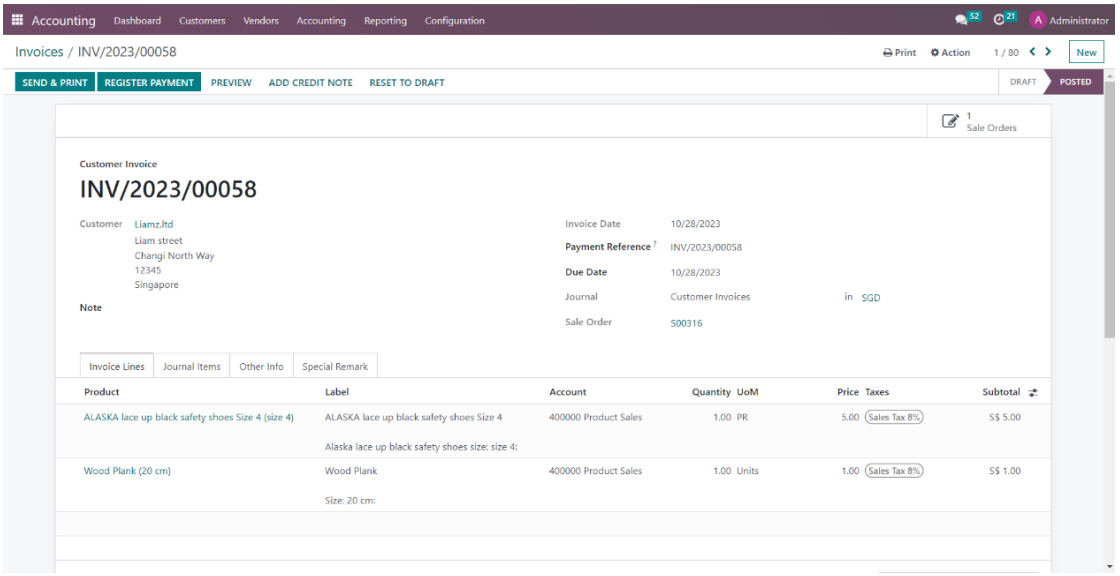


After the Customer Paid fully you can see the Partial now change to Paid

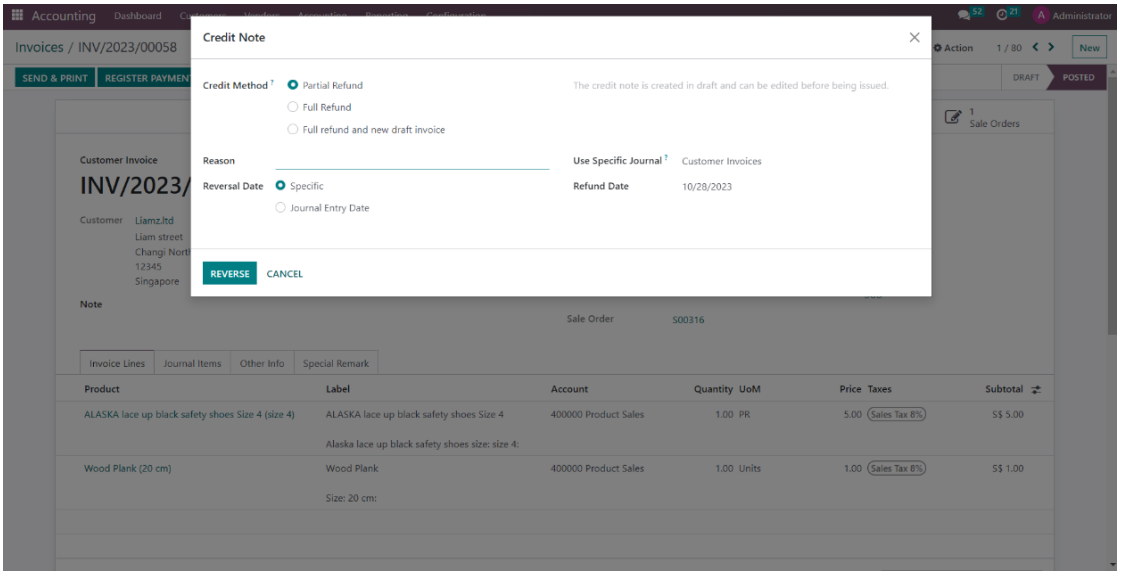


Then to check on the Invoice Report we can click the Action Button then Click the Invoice menu

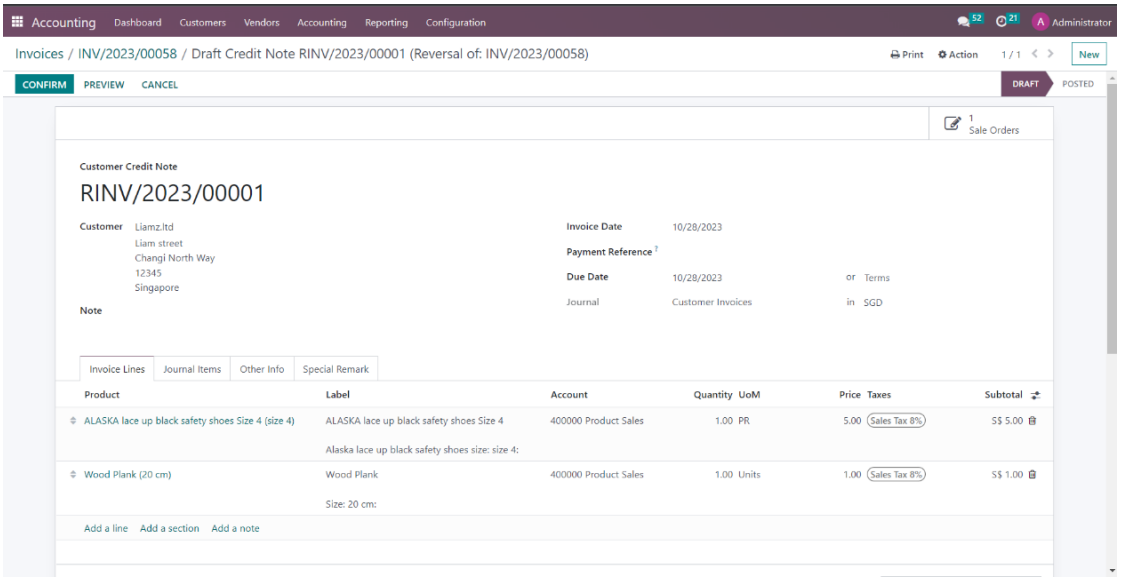
8.3. Credit Note



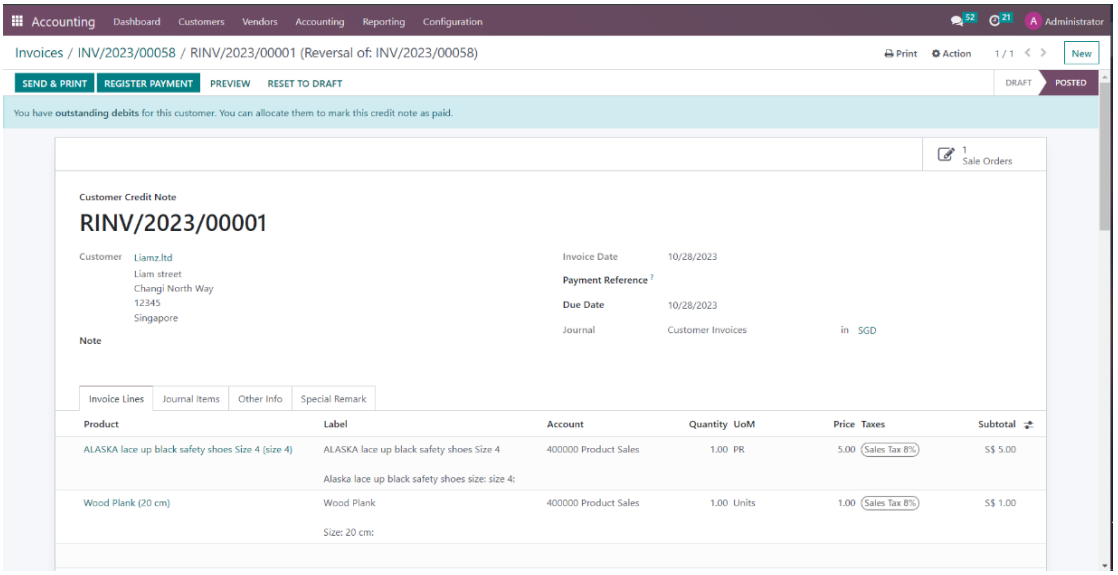
For Credit Note, first scenario we can create it from existing Invoice for example we will use this INV/2023/00058 invoice. We then can click the **Add Credit Note**.



After that Pop-up will be shown, we can select the option based on our goal and there will be an explanation of each **Credit Method** on the right side. We can also set the reason and Journal Entry Date. After setting this up we can click the Reverse Button.

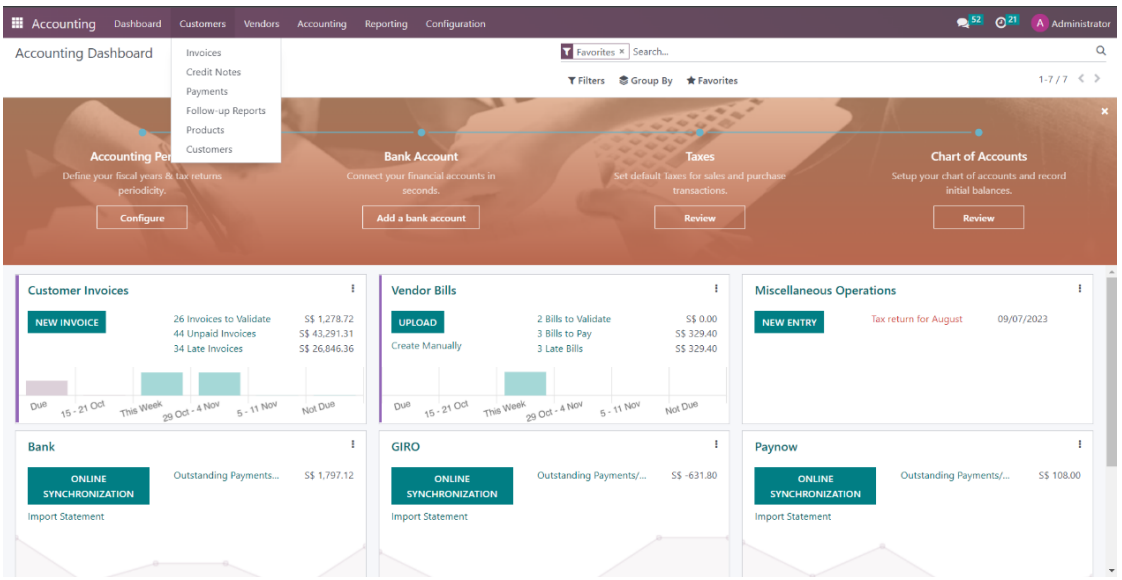


On Click the system will generate a Credit Note based on the Invoice and the selection we choose on the Pop-up before. Right here we can see the details of the Credit Note, and after making sure everything is fine, we can click the Confirm Button to Confirm the Credit Note.

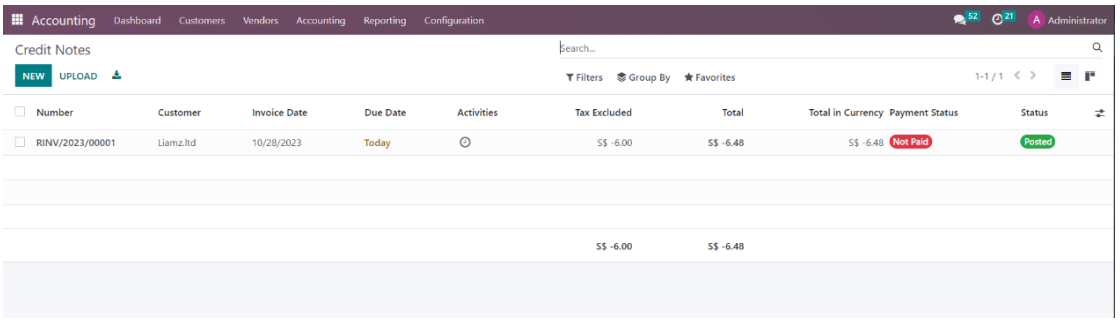


In another scenario we can create a Credit Note without the need for an invoice, for this we can go to the Main Dashboard.

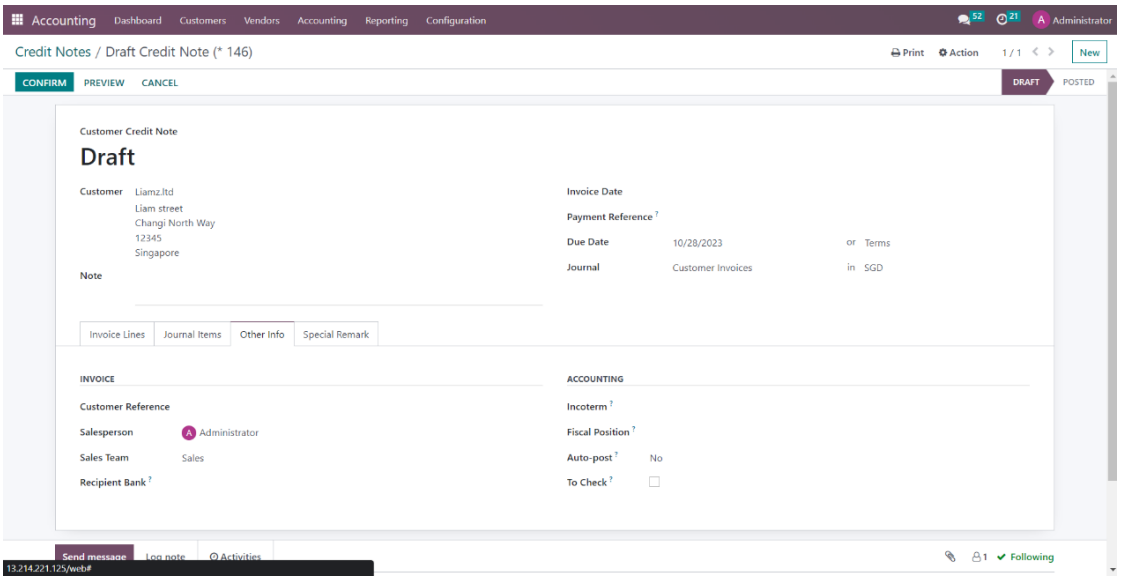
From the Main Dashboard, we can click the Accounting Module.



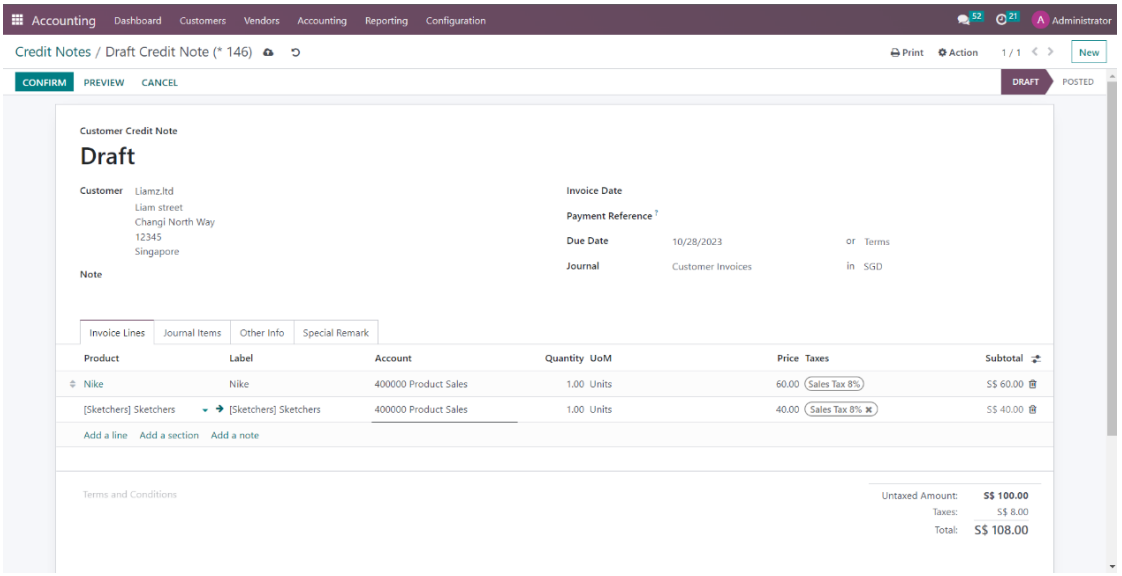
From here we can click the Menu Customers, then click the Submenu Credit Notes.



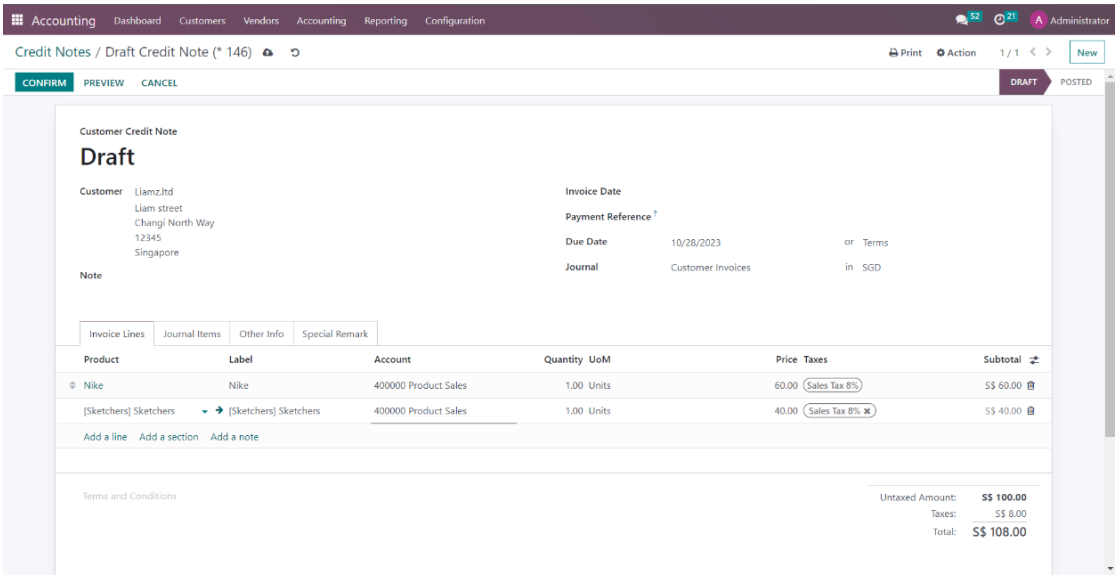
Then right here we can see all the Credit Notes data, we can then click the Create Button.



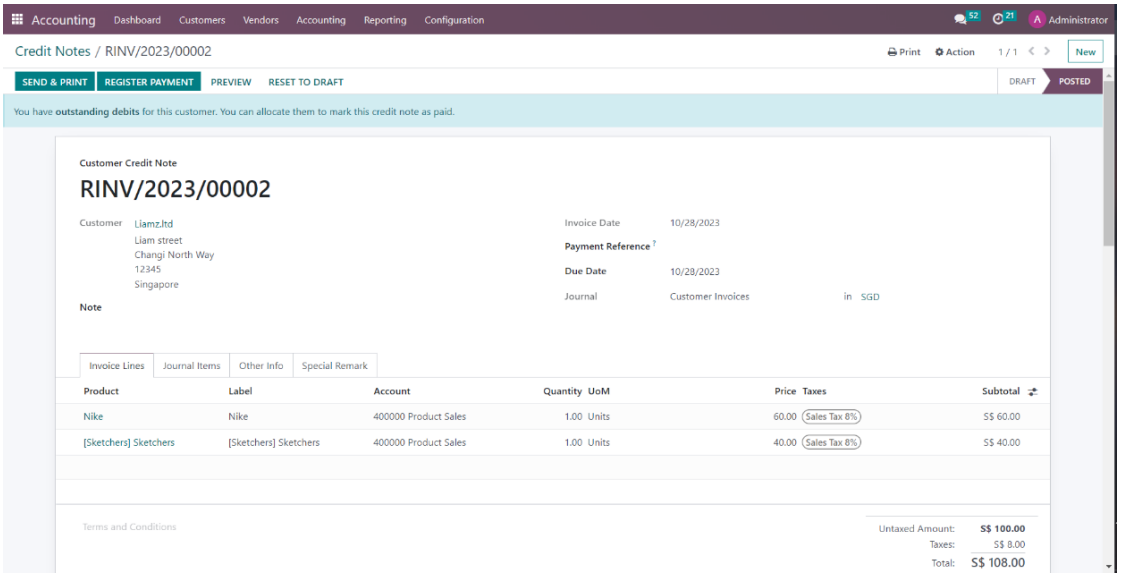
After that, we can set up the data of the Credit Note, and we can see more details in the Other Info tab.



Then we can set the Product in the Invoice Line Tab.



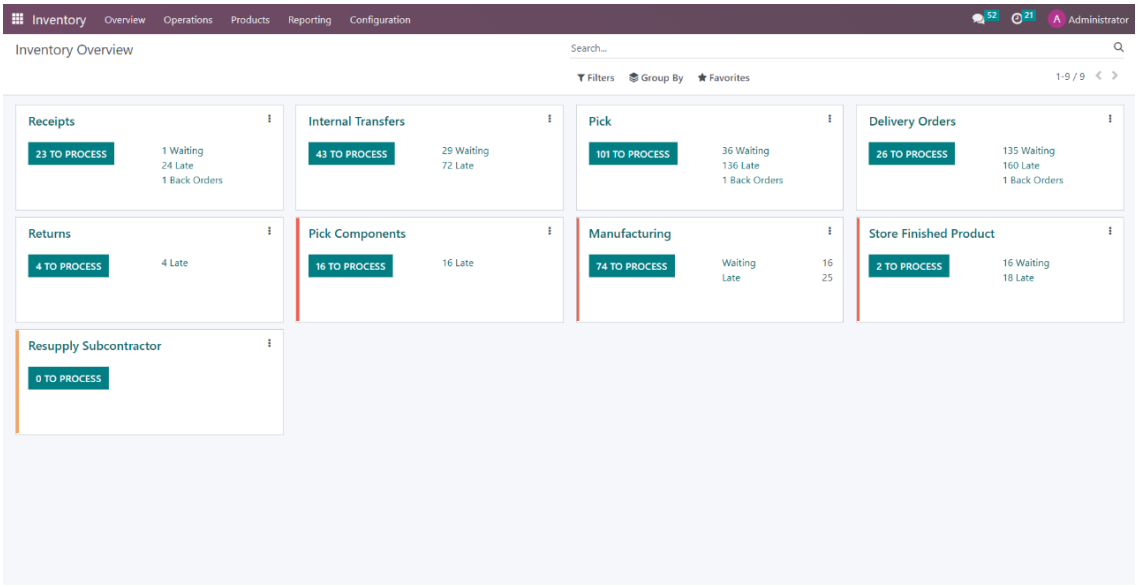
Then after we finish setting up the Credit Note then we can confirm the Credit Note.



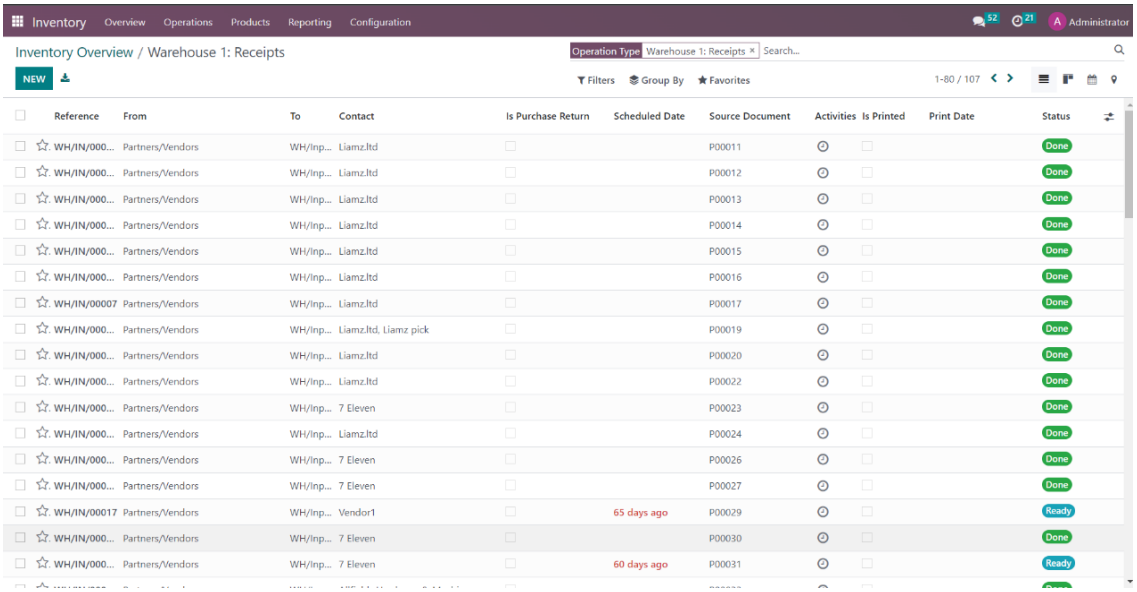
9. Stock Operation and MRP

9.1. Receipt

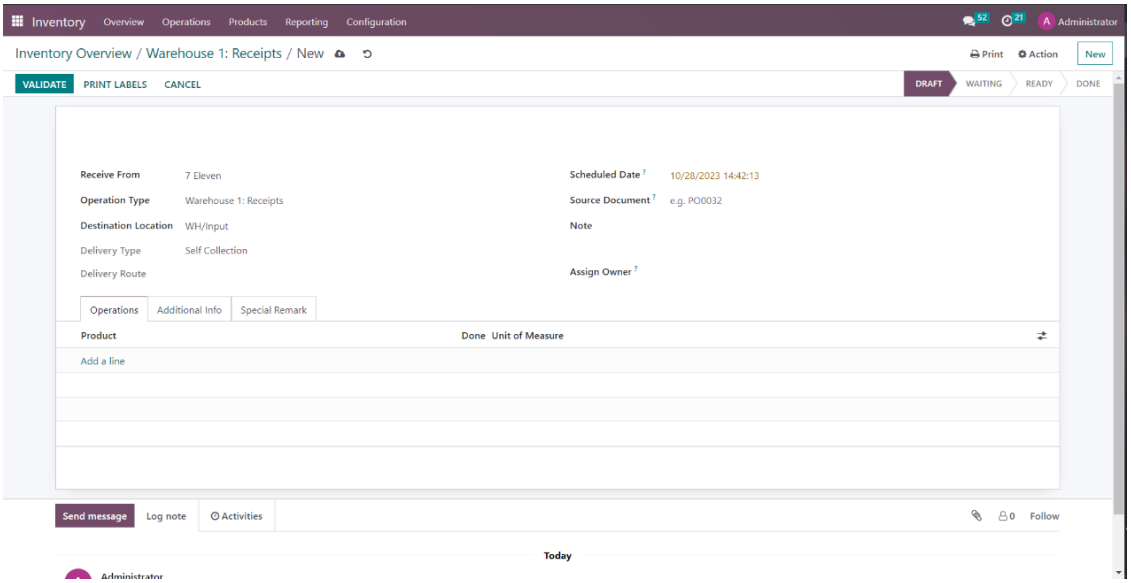
We can create a Receipt by going into the Inventory Module from the Main Dashboard.



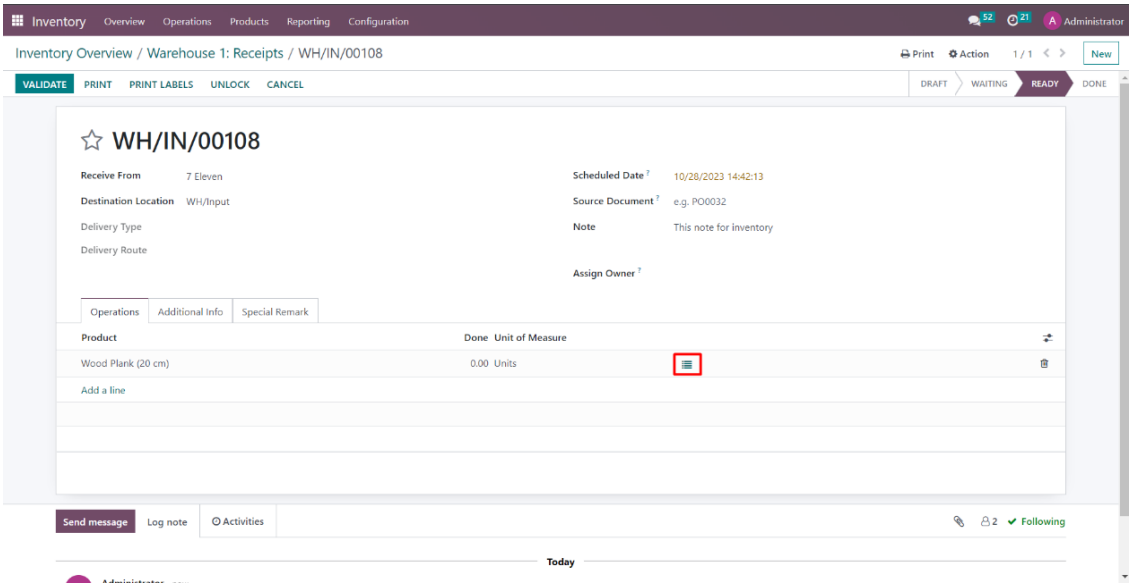
Right here you can see all the **Stock Operations** we will choose Head Office Receipts **(**Not Job Order: Receipts).



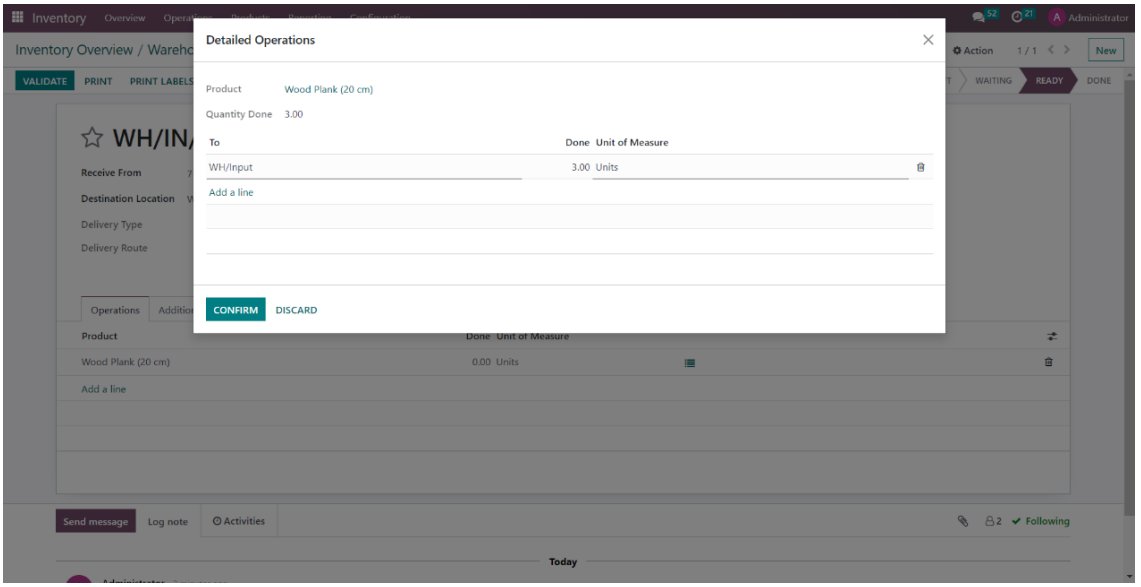
Right here we can see all the current Receipts that have been created for Head Office Warehouse. We can then click the Create Button.



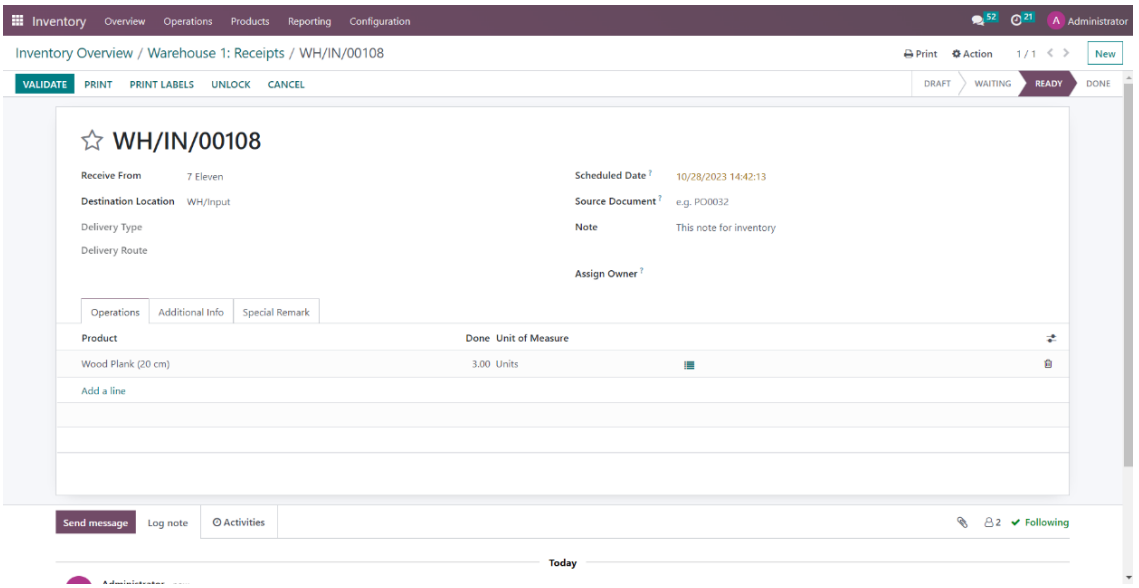
Here we can fill in all the details. For the location of the Receipt, we can set it on the Destination Location. Then after that we can set the Products on the Operations then click the Save Button.



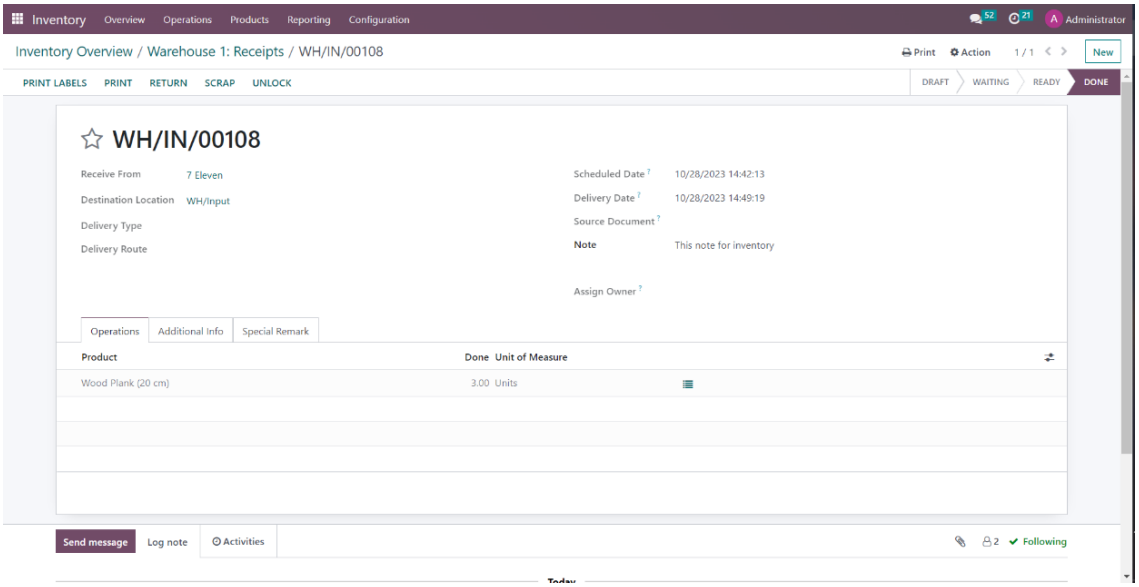
After saving the Receipt, to input the Products Quantity we can click the 4-stripe button beside the Unit of Measure on the Operations Tab.



On Click a Pop-Up will be shown and we can set where to set the Products, then set the Lot Number, and the how many Done Quantity. After that we can click the Confirm Button

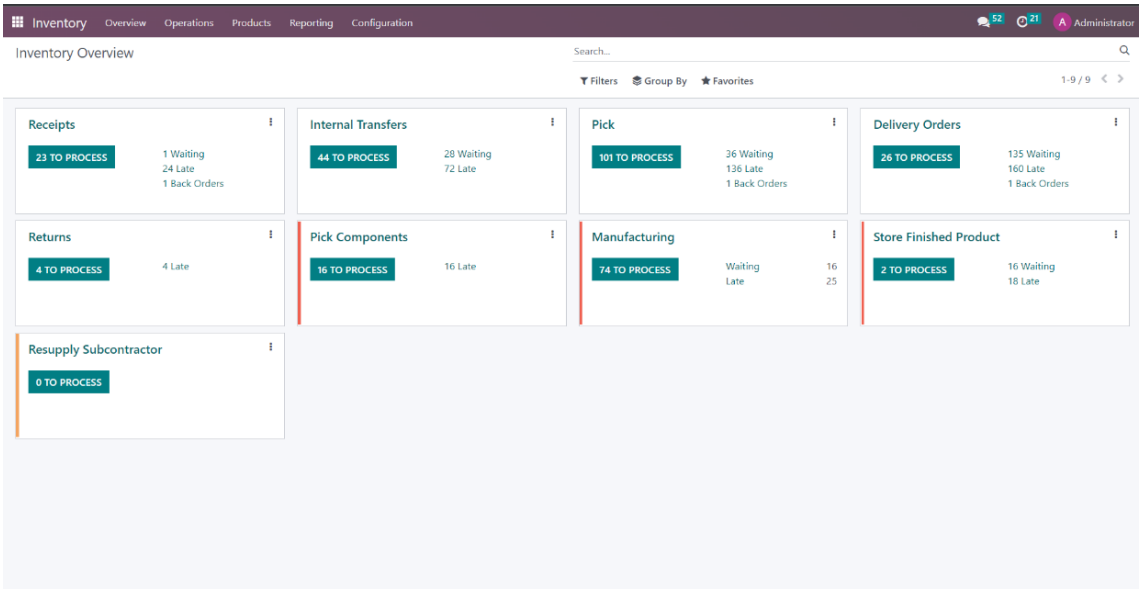


On Confirmation then we can see the Done on the Operations tab have been changed. Then we can proceed to Validate the Receipt.

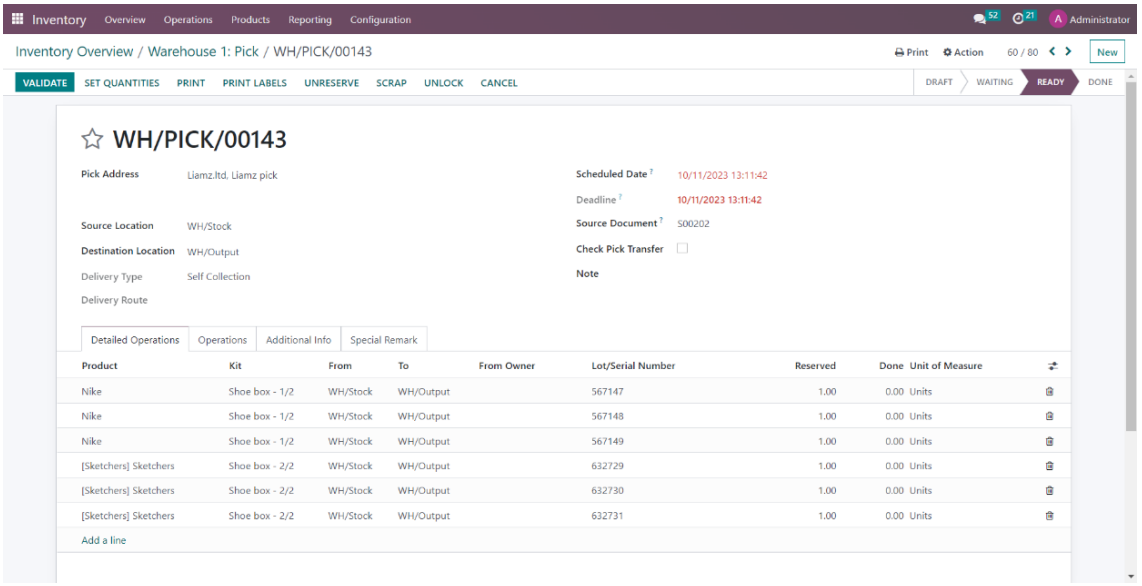


9.2. Checking Approval

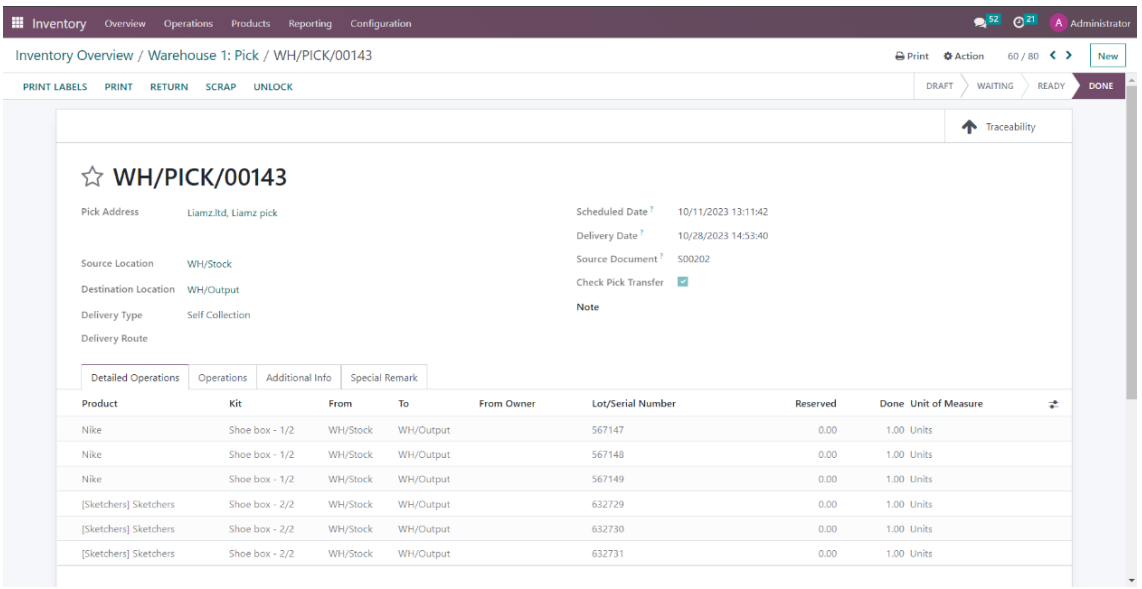
We can Checking Approval by going into the Inventory Module from the Main Dashboard.



In Inventory Dashboard Select Pick that is ready



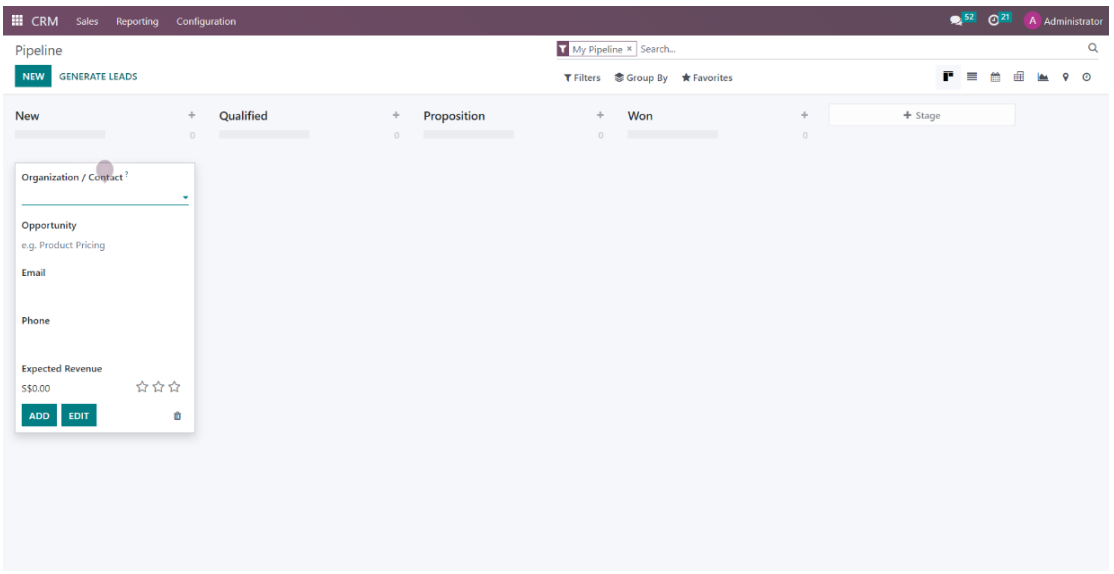
Click the pick and then fill the Done Qty, tick the check pick transfer checkbox and Validate



10. CRM

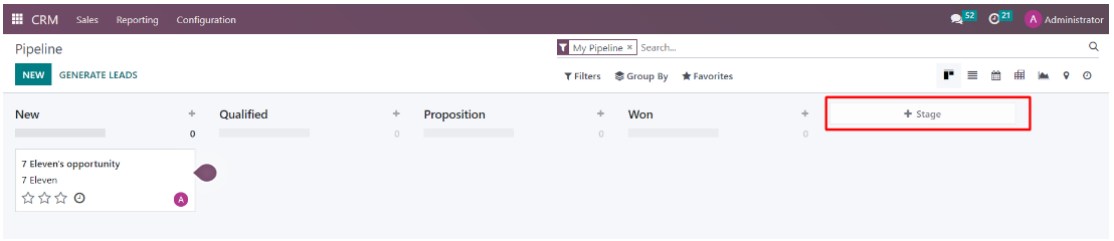
10.1. Leads

On the main dashboard Click CRM module

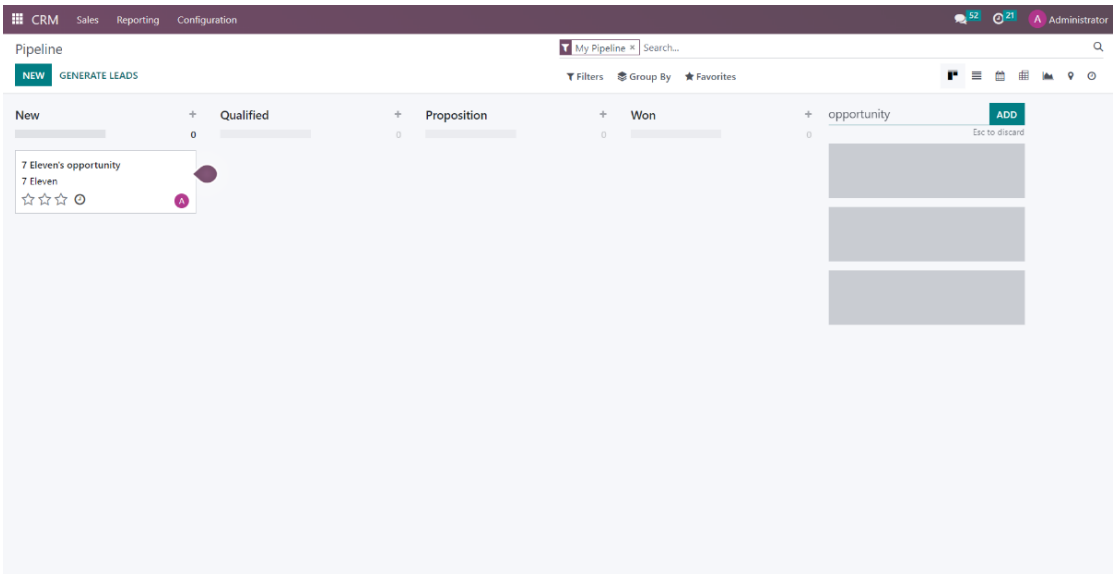


Then Create new record On Sales > My Pipeline and user need fill this information.

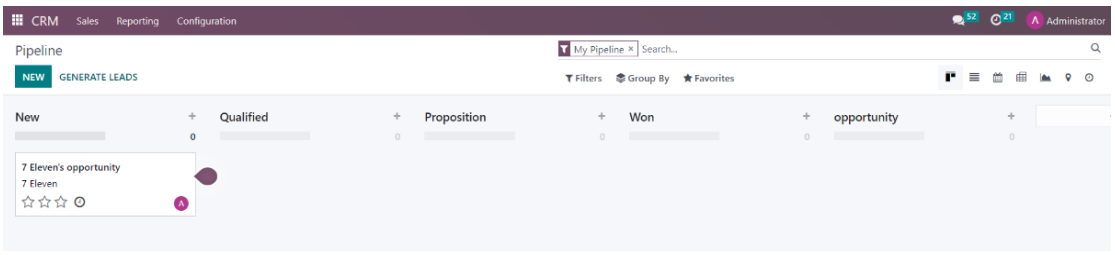
10.2. Add more stages in the pipeline

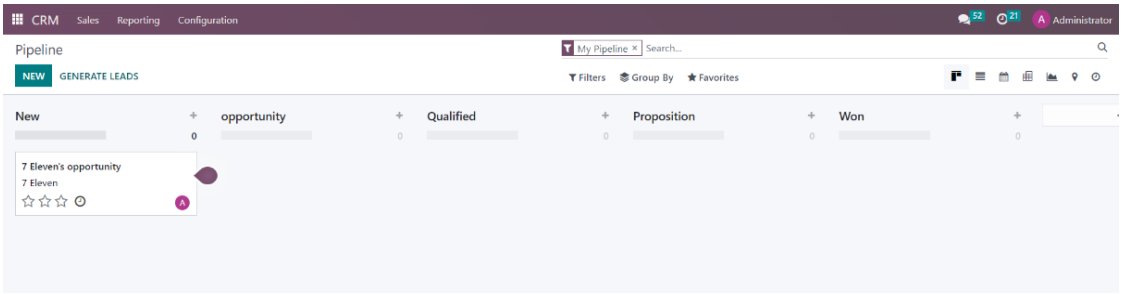


To add a stage in the pipeline, click on this + stage button, key in the stage name and add



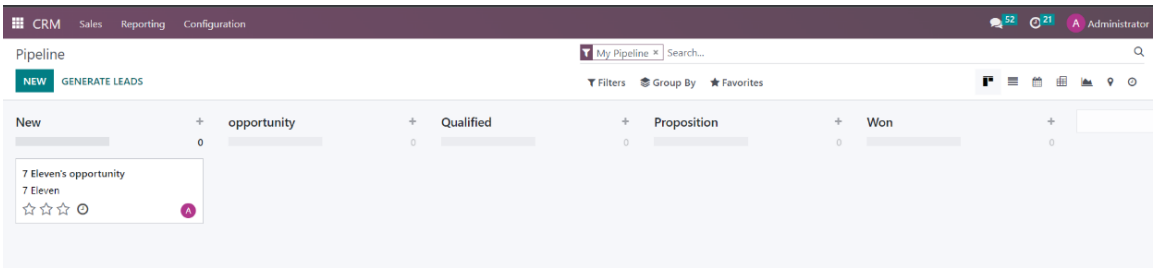
Arrange the position of the stage, by dragging the range and putting it in the position desired

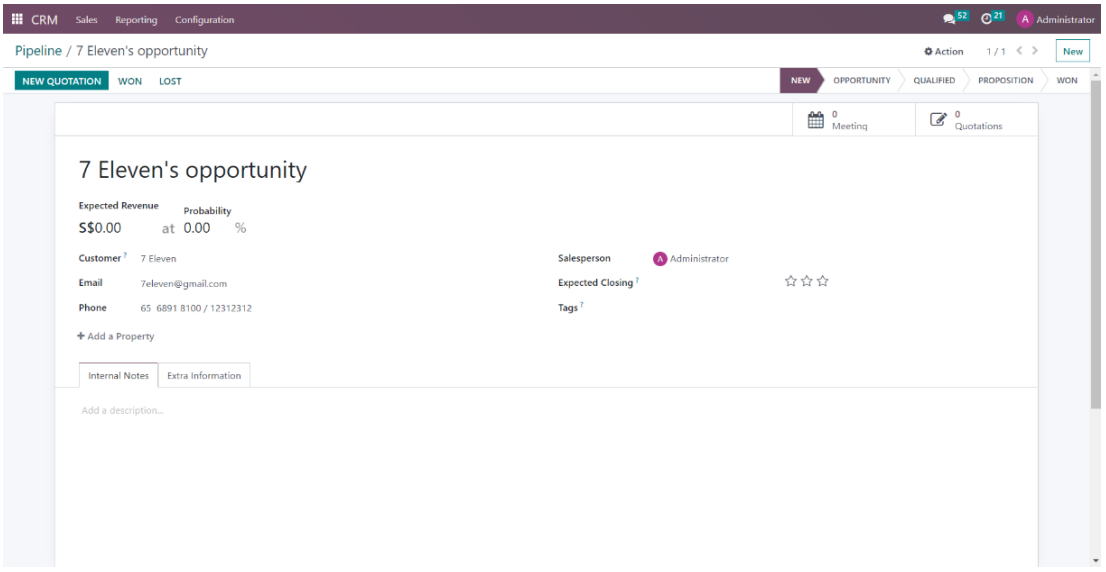




10.3. Sales Quotation

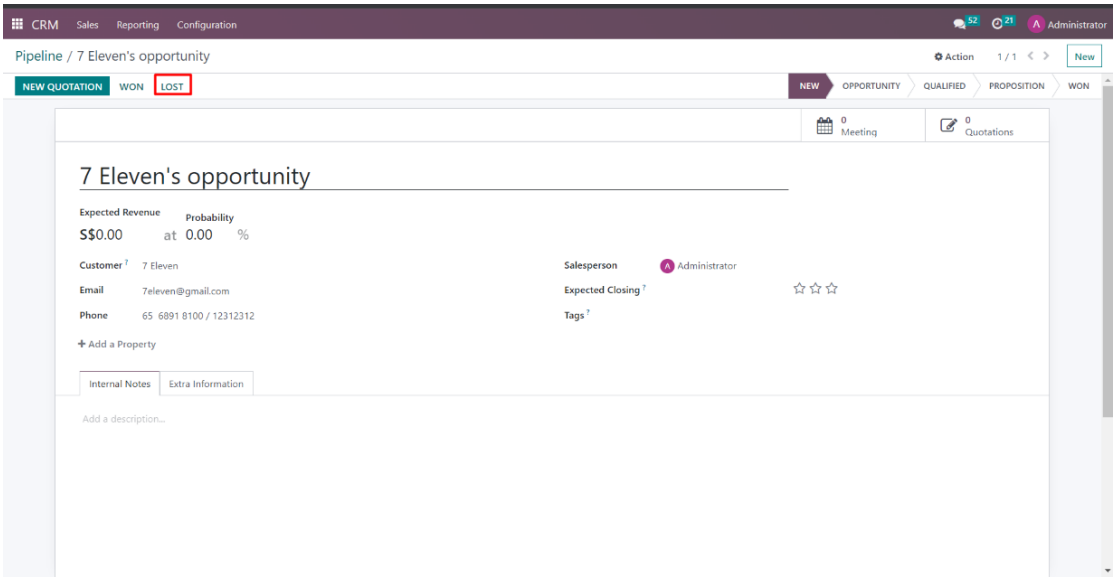
To convert from Leads to Sales Quotation, click the lead





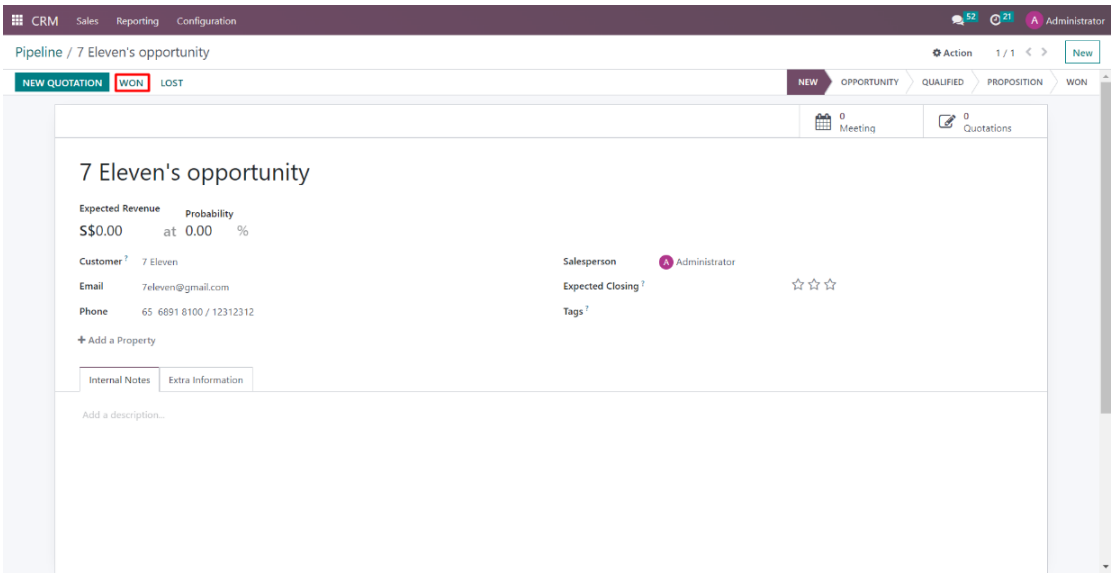
From Lead/Opportunity need click the" **New Quotation**" Button

10.4. Lost



To set Lost in CRM View Click the Button" **Lost**"

10.5. Won

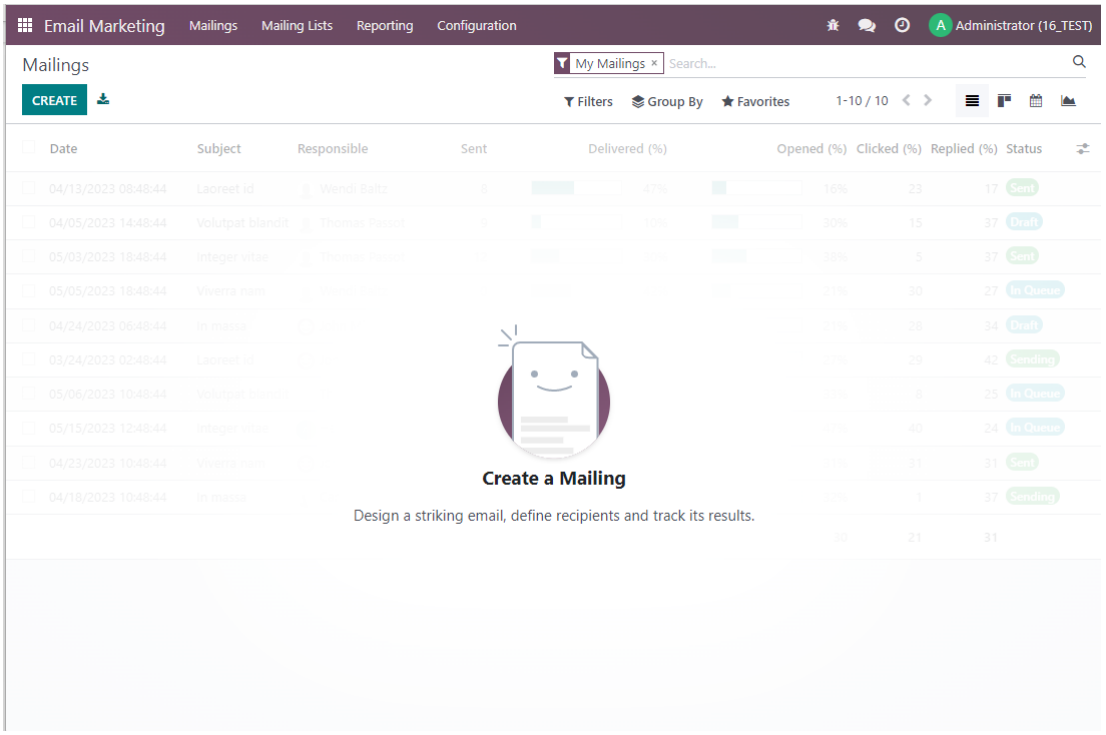


For Set the Won need click the" WON**"** Button.

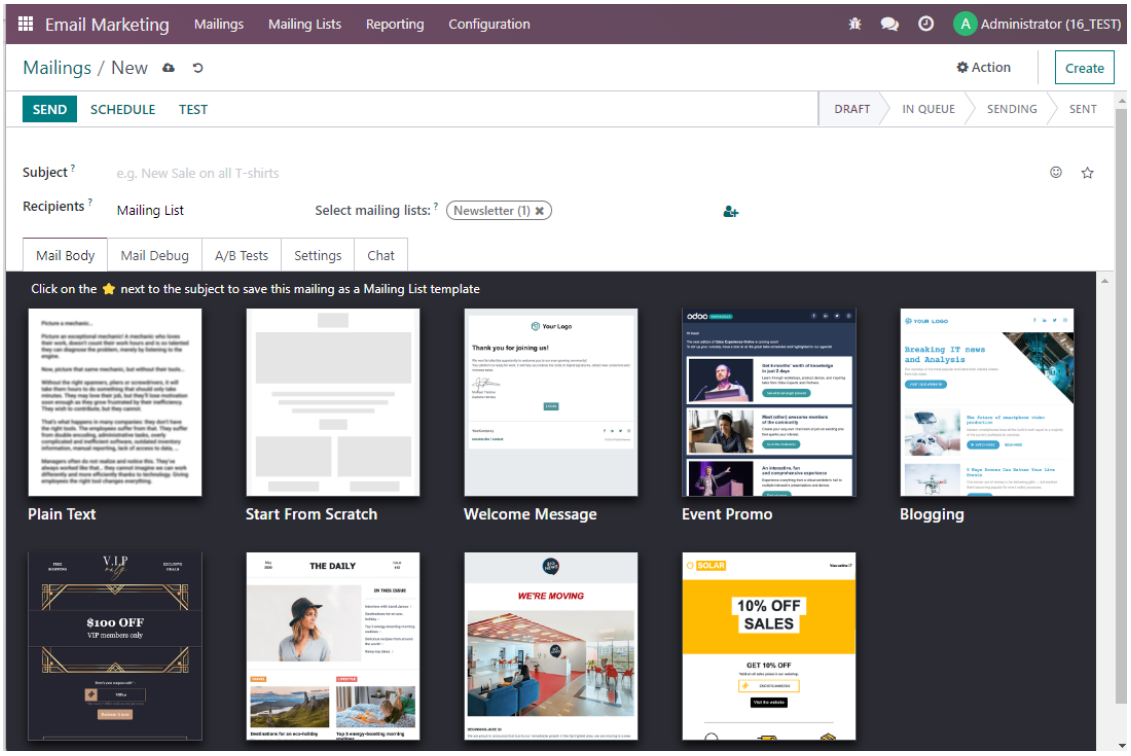
11. Marketing

11.1. Marketing Module and EDM

We can use Marketing by going into the Email Marketing Module from the Main Dashboard.

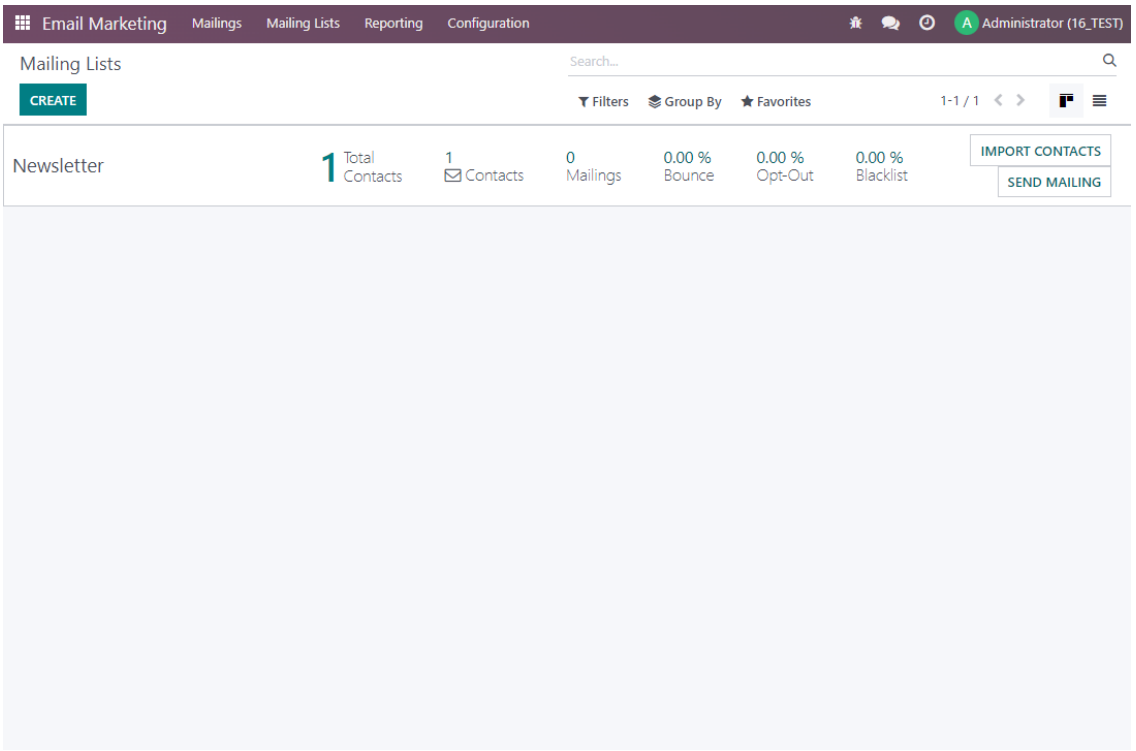


Click ”Create” button to create new Mailing



Select Customize email template and send out to customer

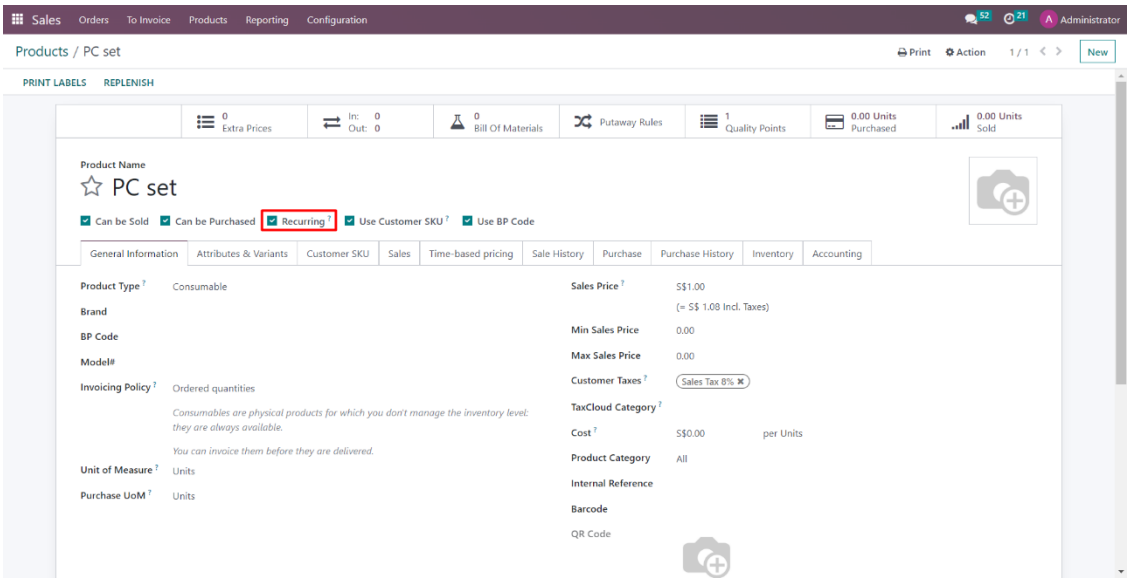
11.2. Email list



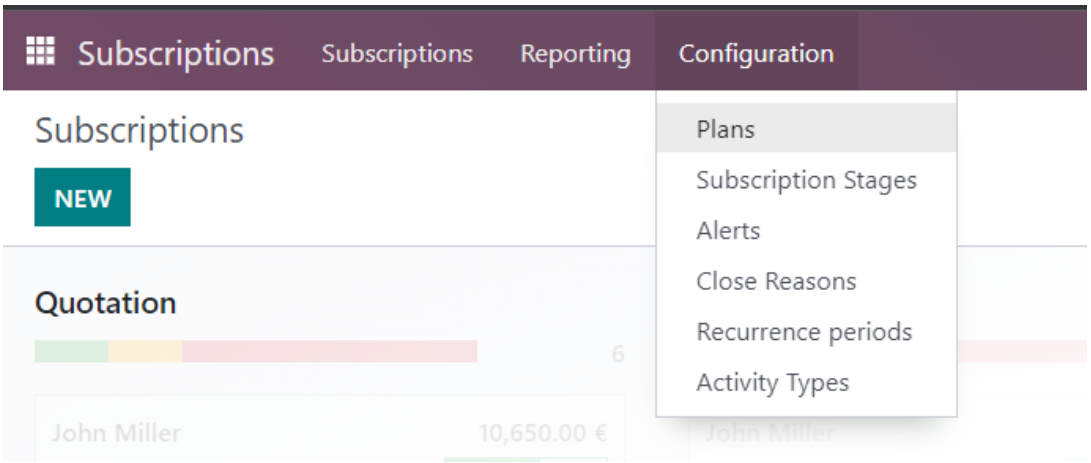
to Check email list, you can open Mailing List on Email marketing > Mailing List

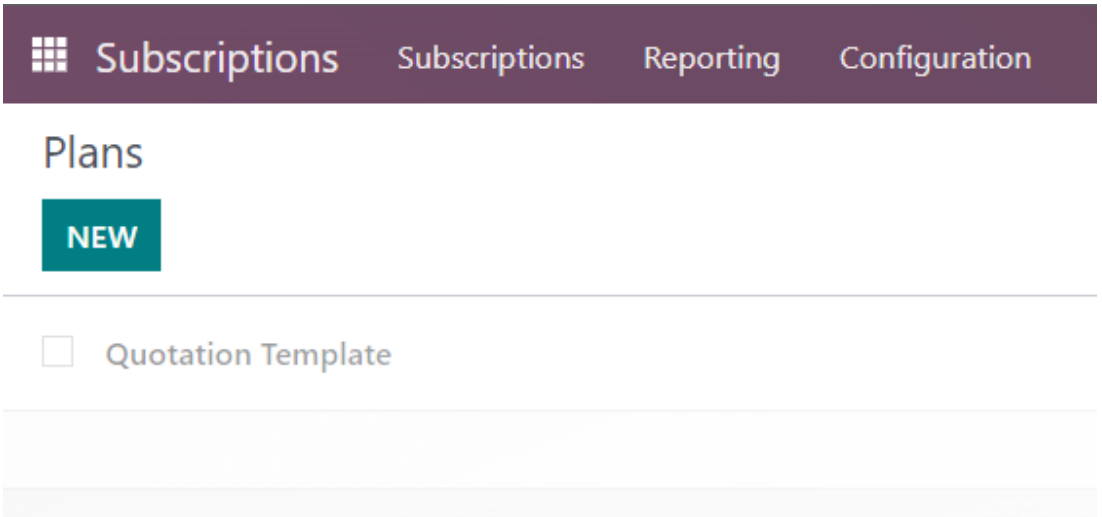
12. Rental

First, in product form. You need to thick recurring checkbox.

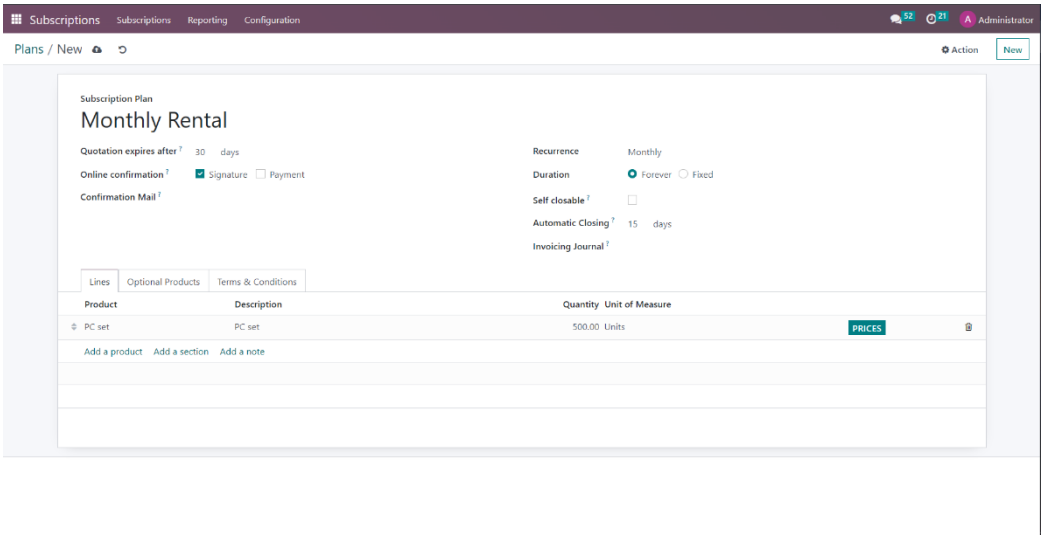


Go to Subscription modules > configuration > plans. Click button create.

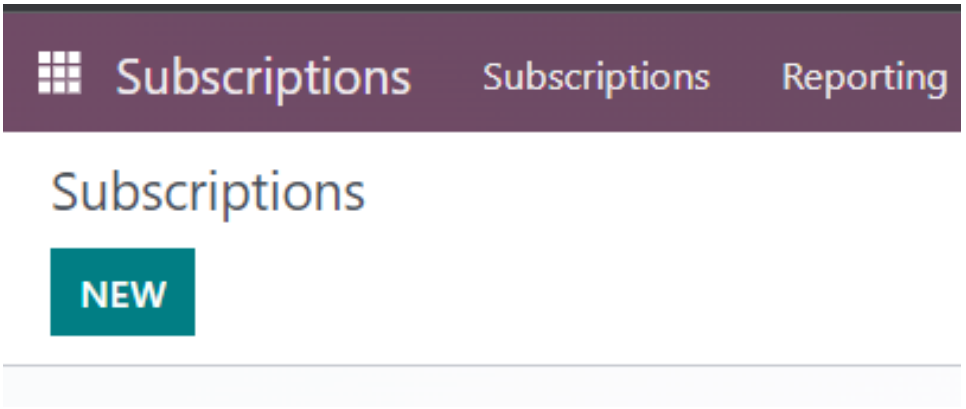




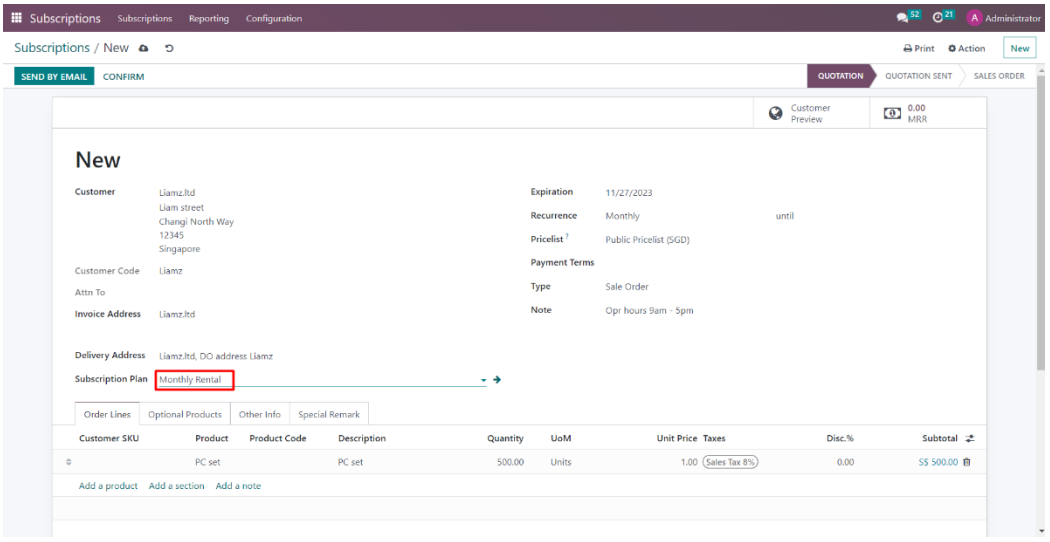
Create plans and key in the information and the product.



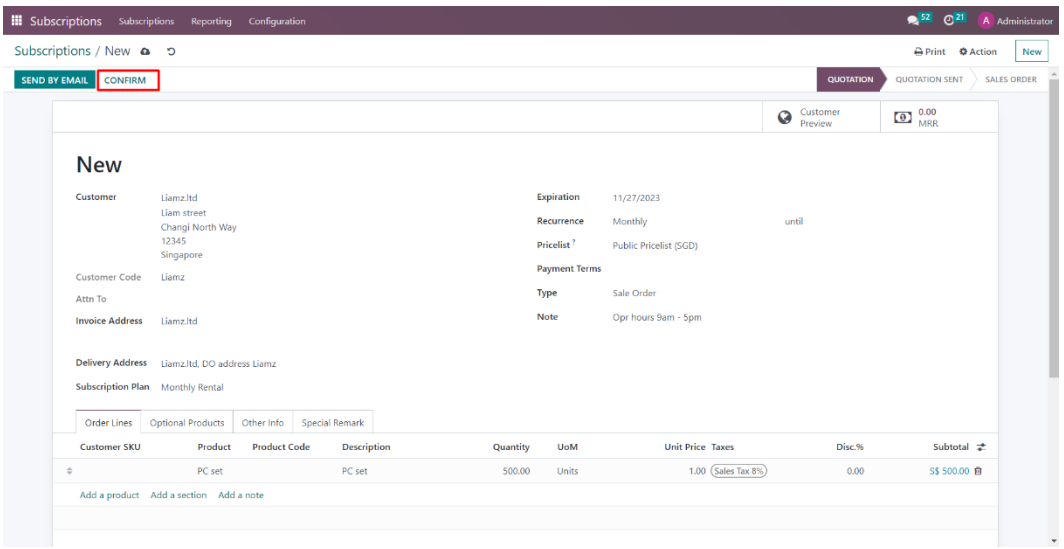
After creating a plan, on the top menu click Subscription menu. Click the create button.



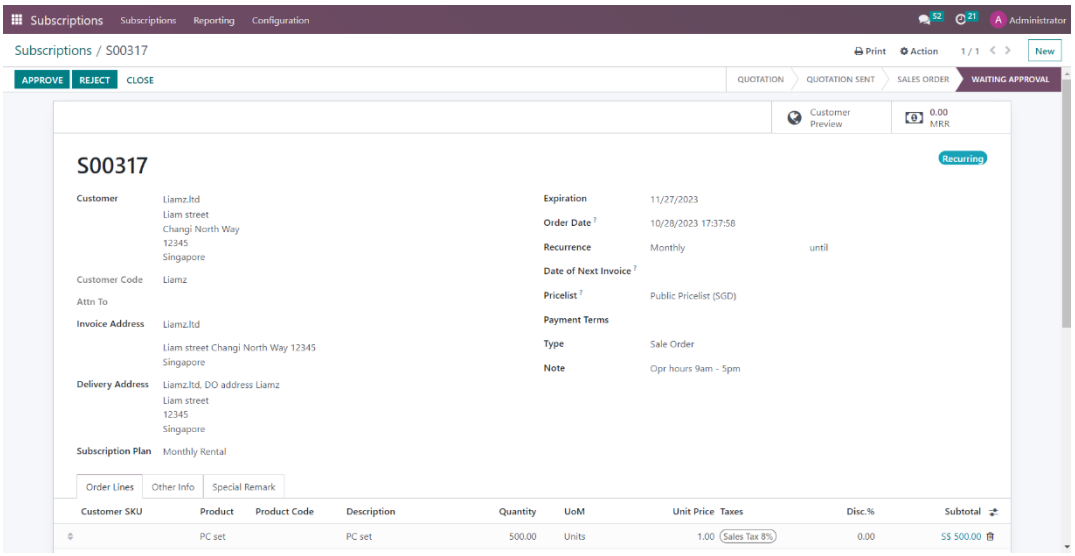
Key in the information and select the subscription plans.



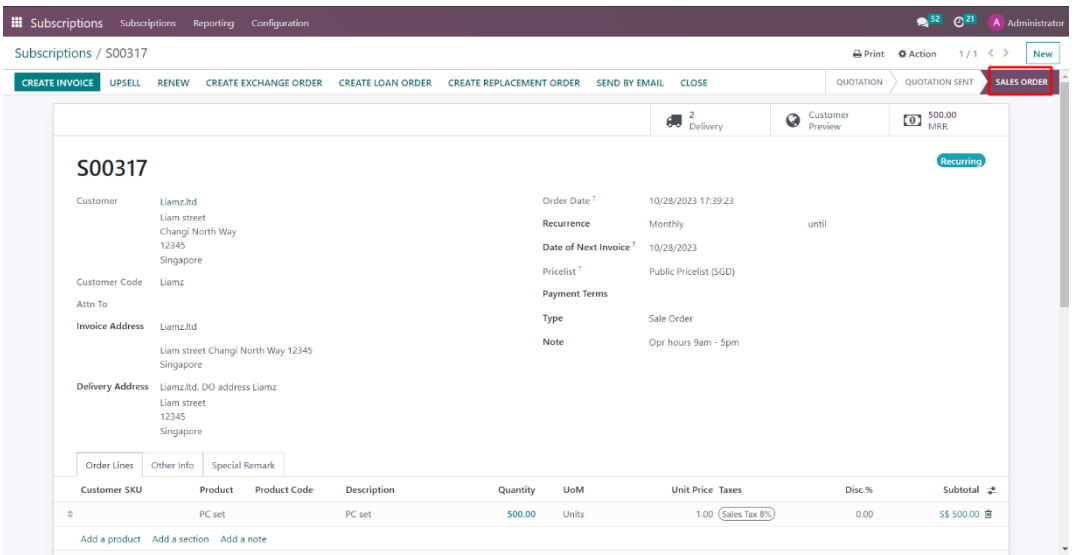
After that, you can click the confirm button. Then the system will create 2 deliveries for this.



The state for the Quotation will be waiting for approval



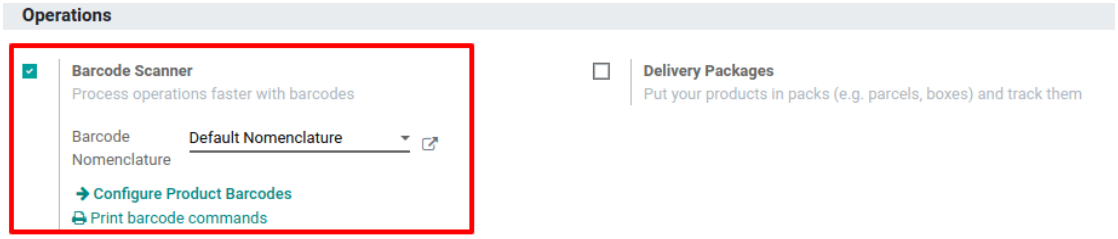
once approved it will turn into a Sales Order.



13. Barcode

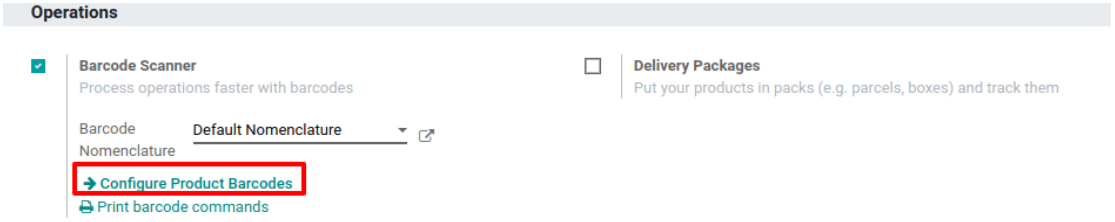
13.1. Configuration

To use this feature, you first need to activate the barcode functionality via Inventory > settings > barcode scanner. once you have ticked the feature, you can hit save.

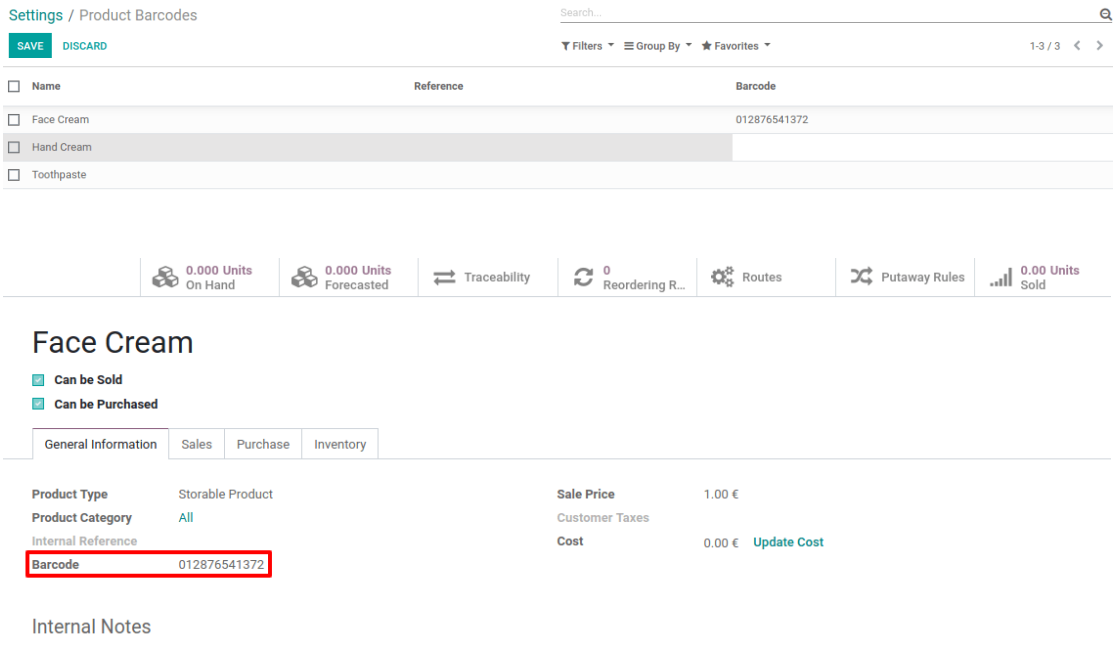


13.1.1 Set product barcodes

You can easily assign barcodes to your different products via the inventory app. To do so, go to settings > configure product barcodes

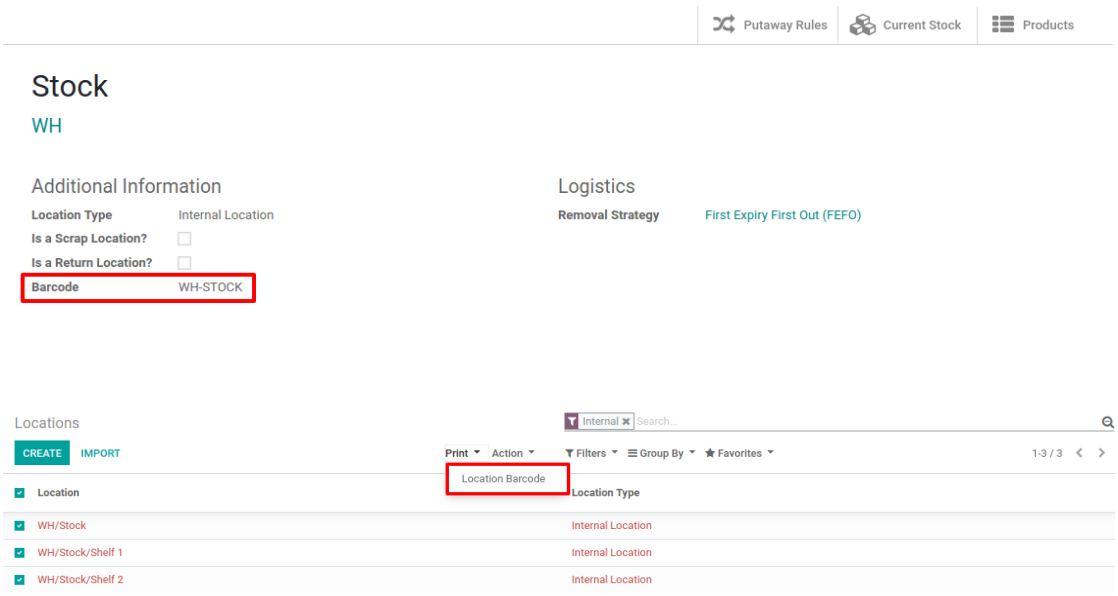


Then, you have the possibility to assign barcodes to your products directly at creation on the product form.



13.1.2. Set location Barcodes

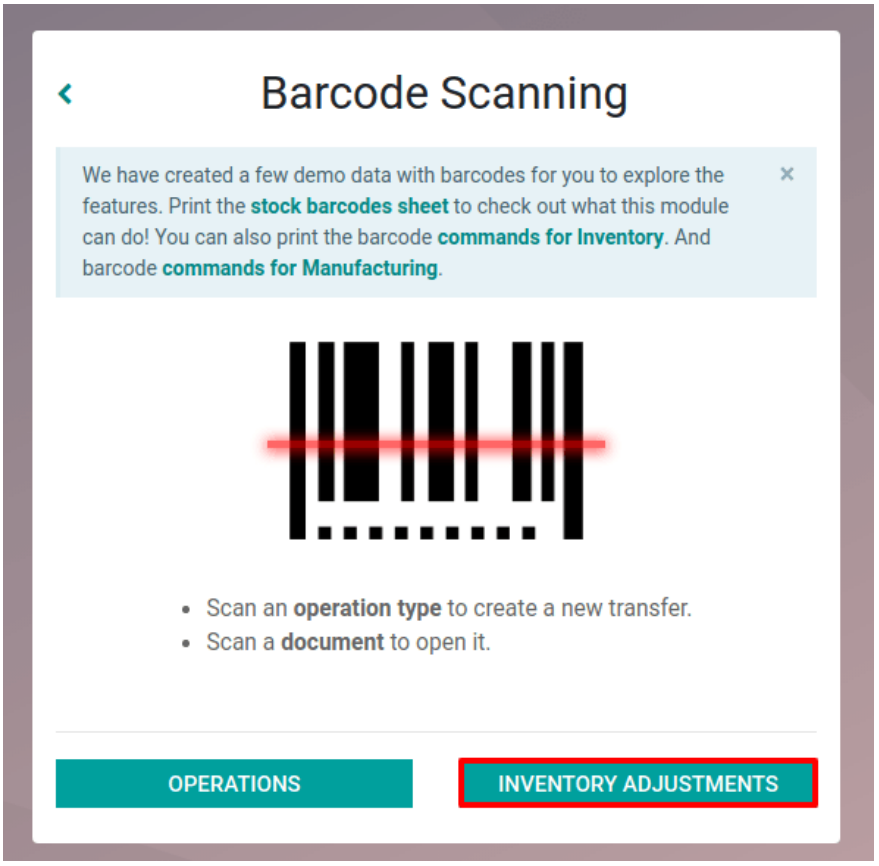
If you manage multiple locations, you will find useful to attribute a barcode to each location and stick it on the location. You can configure the locations barcodes in Inventory > Configuration > Locations.



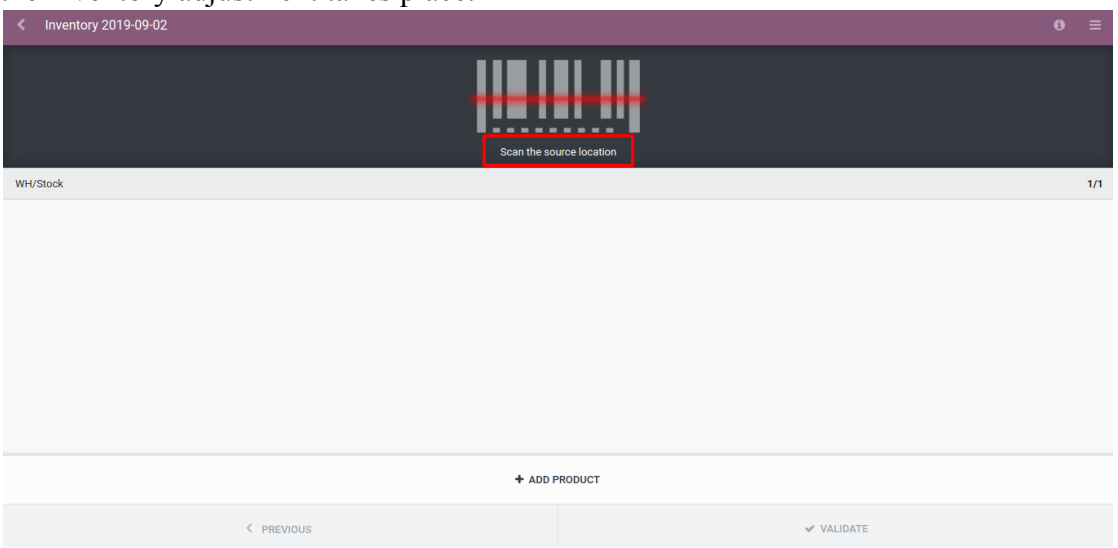
13.2. Daily Operations

13.2.1. Process to an inventory adjustment with barcodes

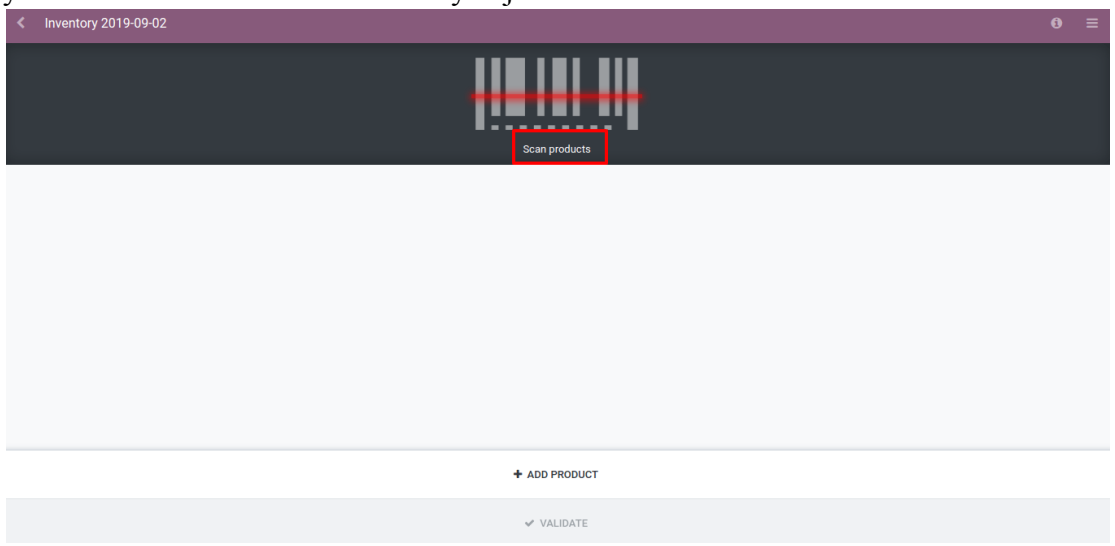
To process an inventory adjustment by using barcodes, you first need to open the barcode app. Then, from the application, click on inventory adjustments.



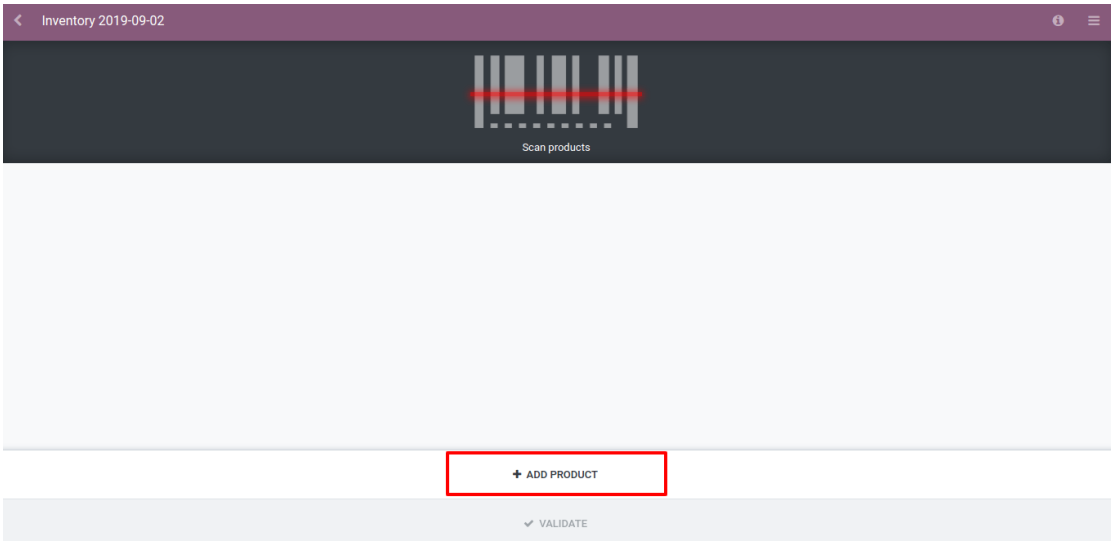
Once you have clicked on *Inventory Adjustments*, system will automatically create one. Note that, if you work with multi-location, you first need to specify in which location the inventory adjustment takes place.

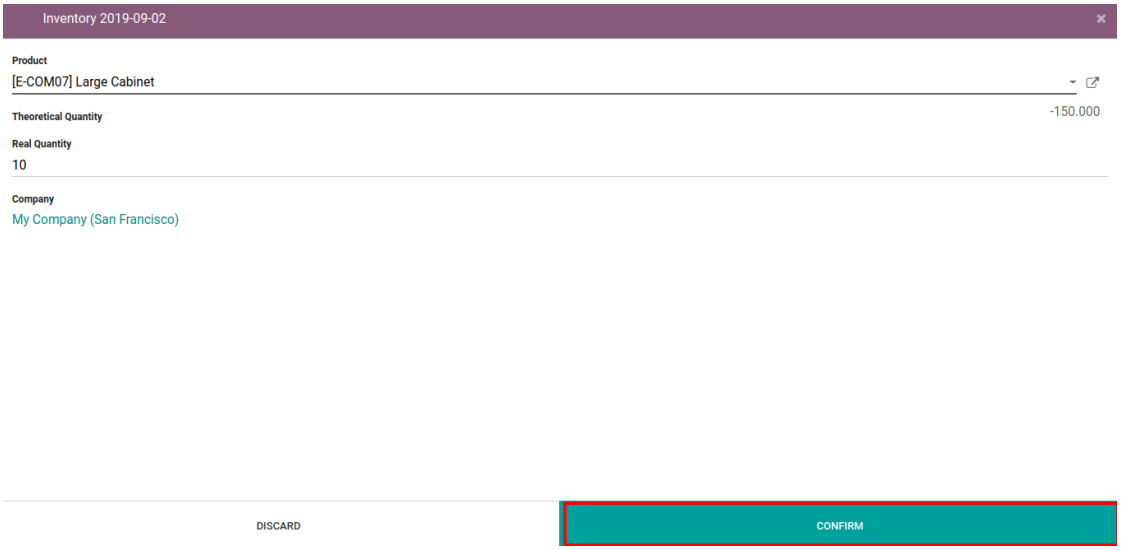


If you don't work with multi-location, you will be able to scan the different products you want to include in the inventory adjustment.

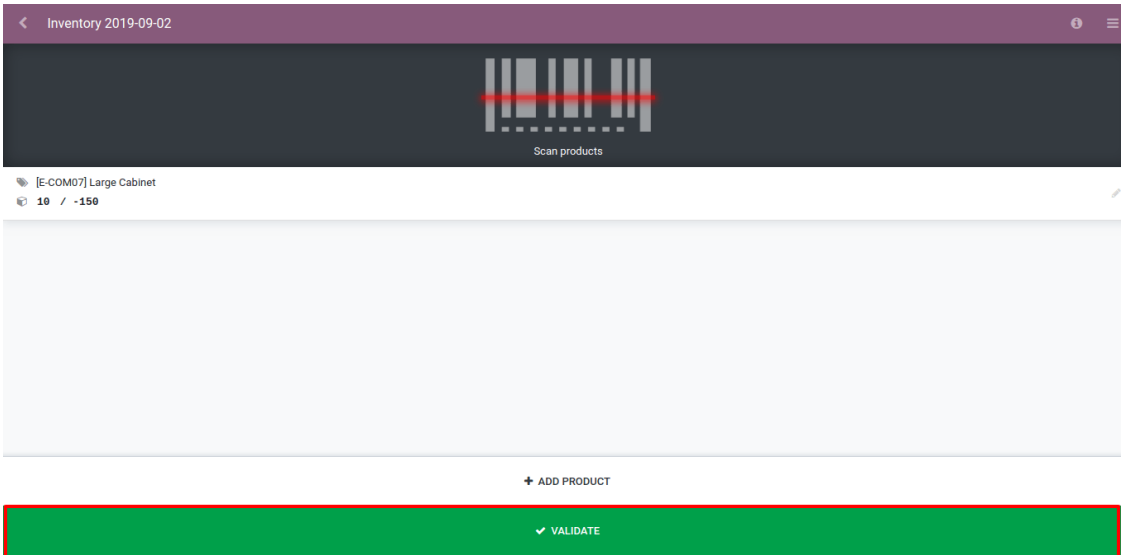


Besides using the barcode scanner, you can also manually add a product if necessary. To do so, click on *Add Product* and fill the information in manually.





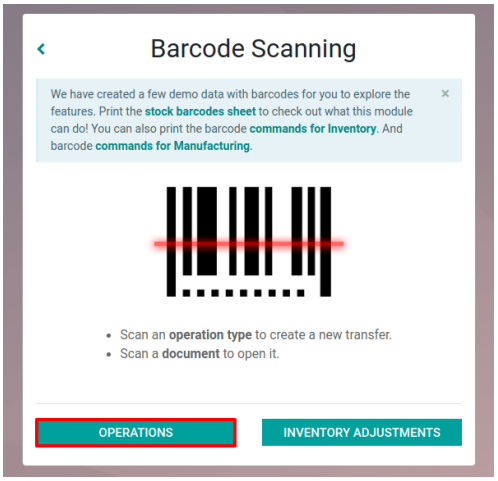
When you have scanned all the items of the location, validate the inventory manually or scan the *Validate* barcode.



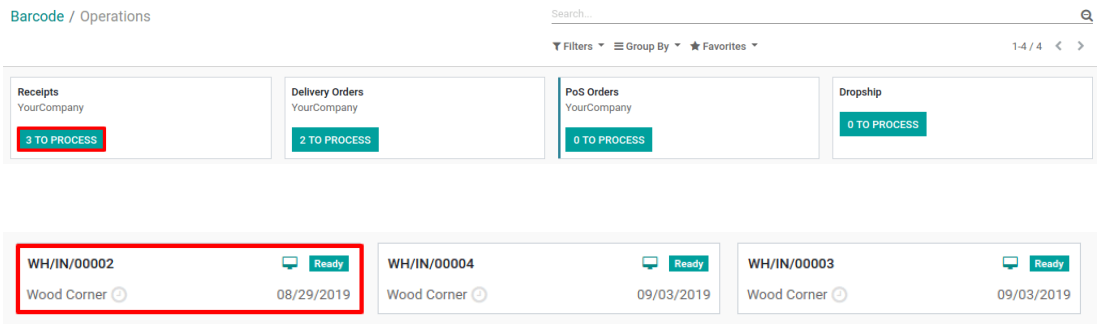
13.2.2. Process to transfers

13.2.2.1. Simple transfer

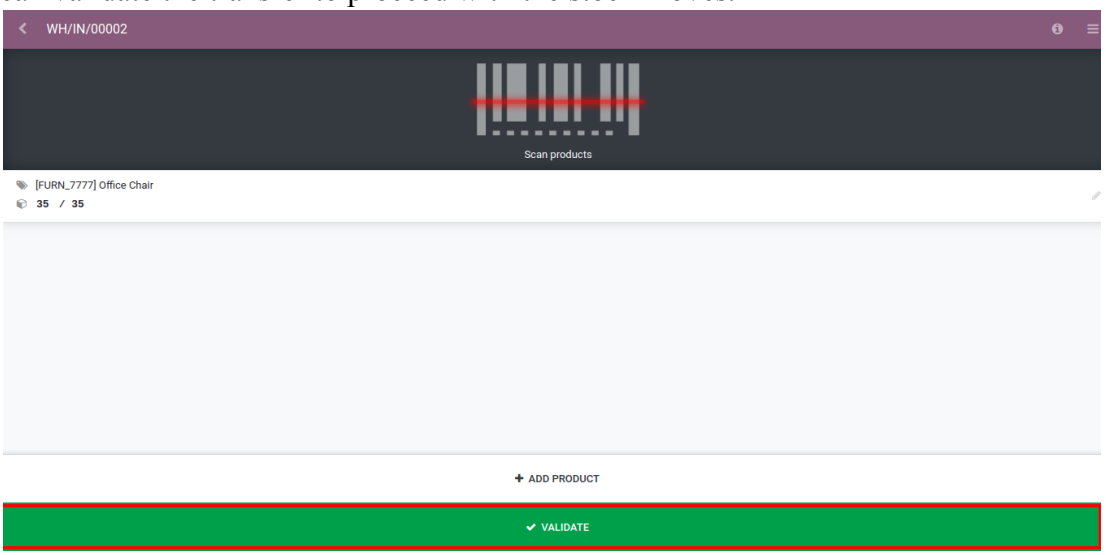
To process a transfer from the barcode app, the first step is to go to operations.



Then, you have the choice to either enter an existing transfer, by going to the corresponding operation type and manually selecting the one you want to enter, or by scanning the barcode of the transfer.

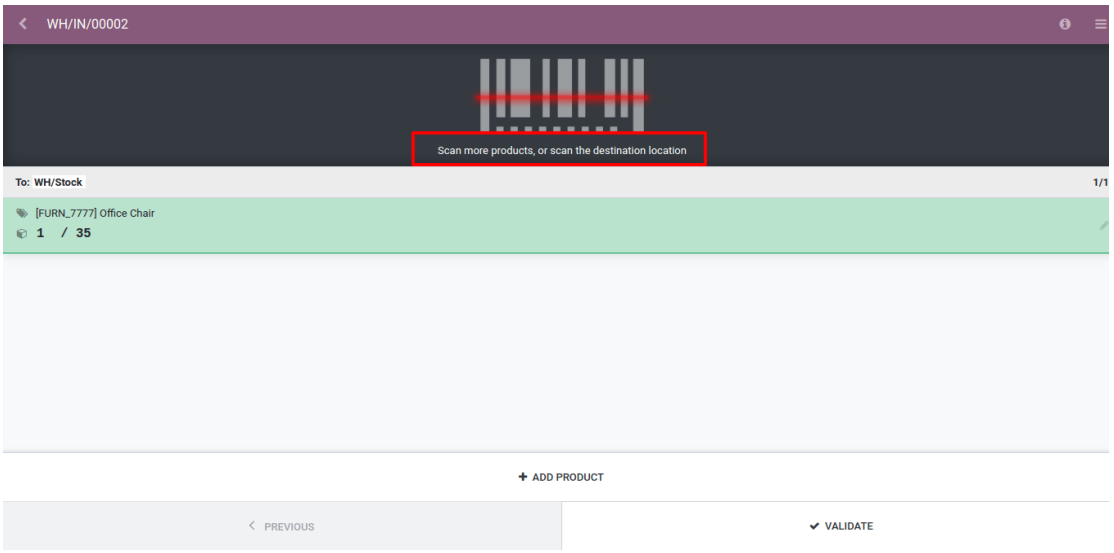


From there, you will be able to scan the products that are part of the existing transfer and/or add new products to this transfer. Once all the products have been scanned, you can validate the transfer to proceed with the stock moves.



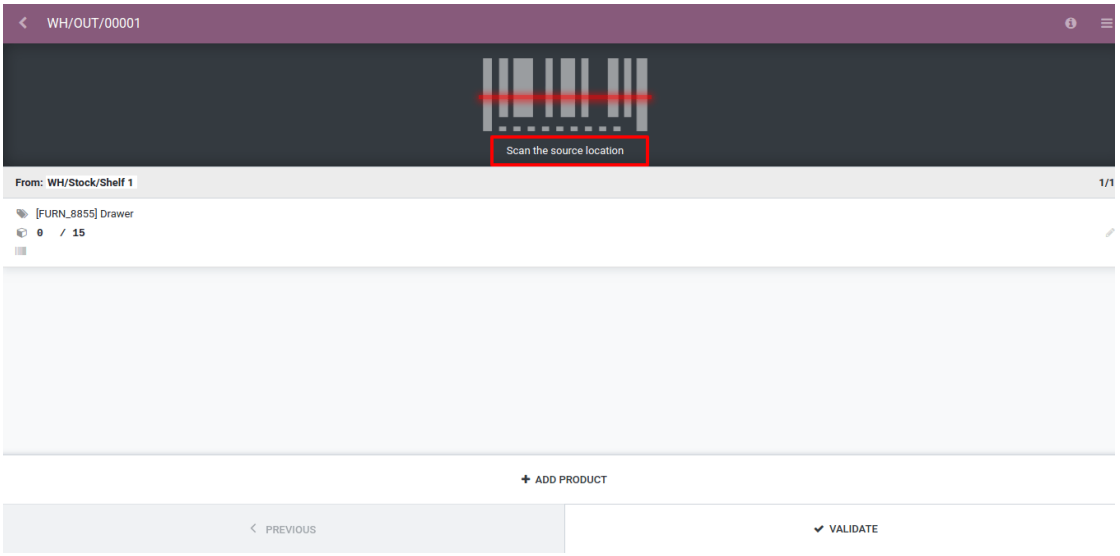
13.2.2.2. Receipts

When receiving a product in stock, you need to scan its barcode in order to identify it in the system. Once done, you can either make it enter the main location of the transfer, for example WH/Stock, or scan a location barcode to make it enter a sub-location of the main location.

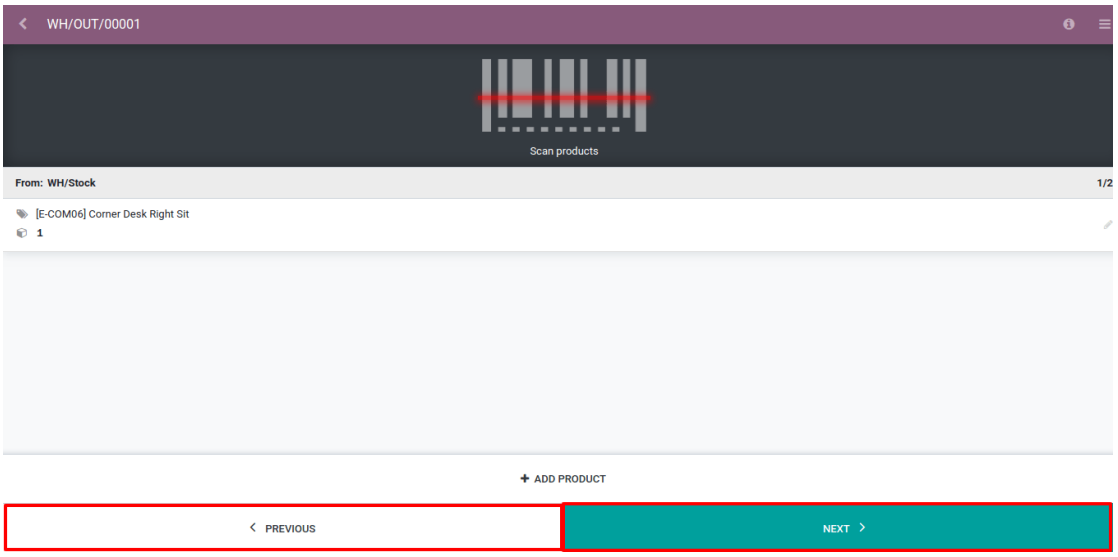


13.2.2.3. Delivery Order

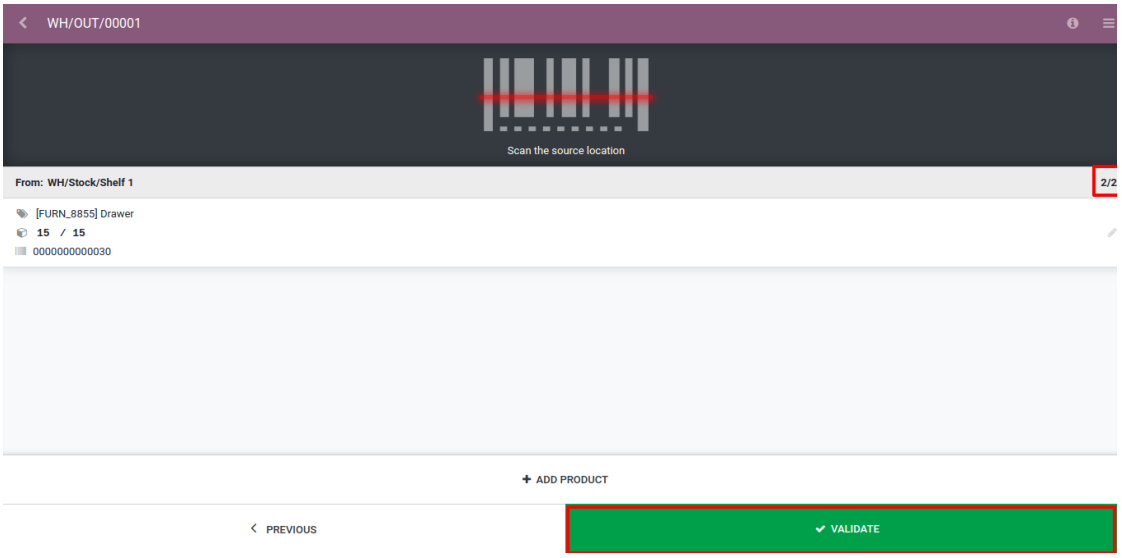
When delivering a product, you have to scan the source location if it is different than the one initially set on the transfer. Then, you can start scanning the products that are delivered from this specific location.



Once the different products have been scanned, you have the possibility to scan another location, such as WH/Stock, and another page will be added to your delivery order. You can move from one to the other thanks to the *Previous* and *Next* buttons.



Now, you can validate your transfer. To do so, click on *Next* until you reach the last page of the transfer. There, you will be able to validate it.



13.2.2.4. Internal Transfer

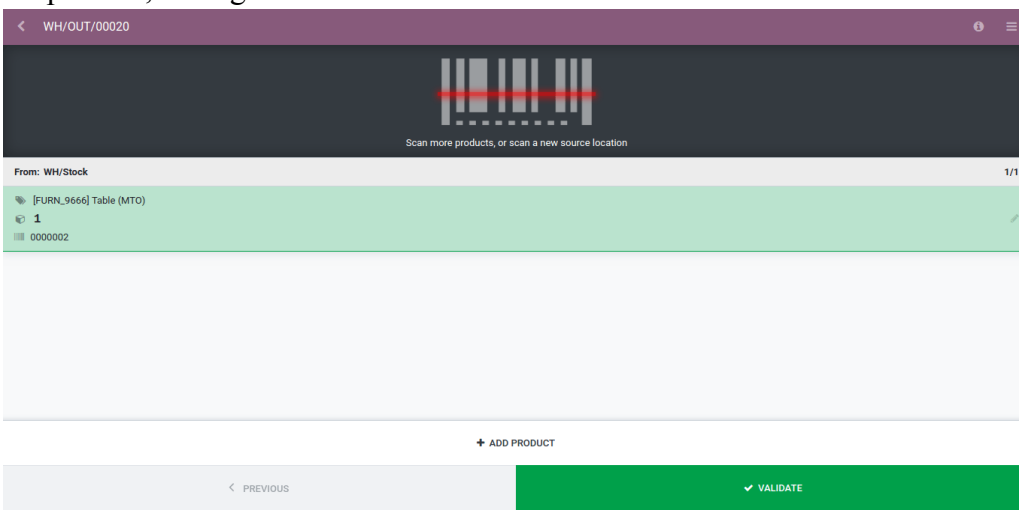
When realizing an internal transfer with multi-location, you first have to scan the source location of the product. Then, you can scan the product in itself, before having to scan the barcode of the destination location.

If the source and destination of the internal transfers are already correct, you don't need to scan them.

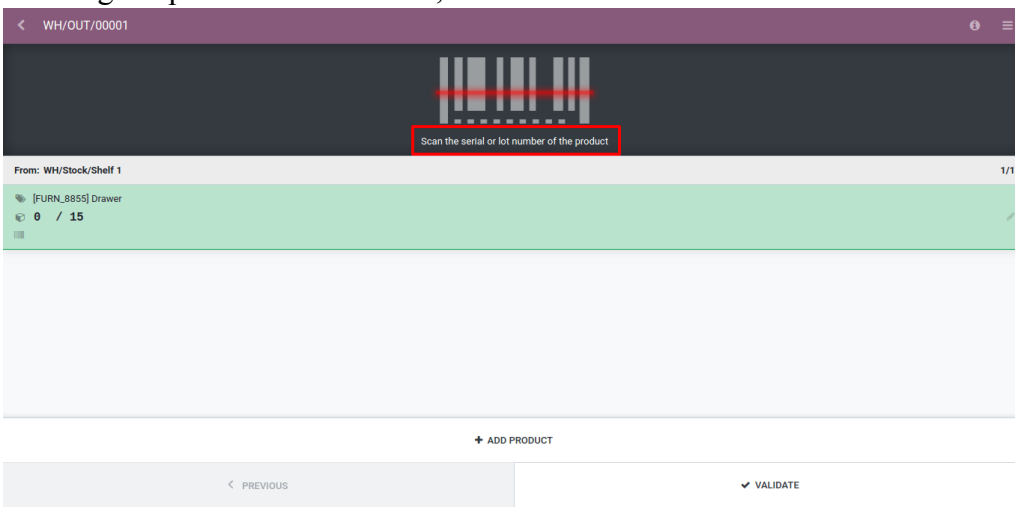
A. Transfers with tracked products

If you work with products tracked by lot/serial numbers, you have two ways of working:

- If you work with serial/lot numbers taking all products into consideration, you can scan the barcode of the lot/serial number and system will increase the quantity of the product, setting its lot/serial number.

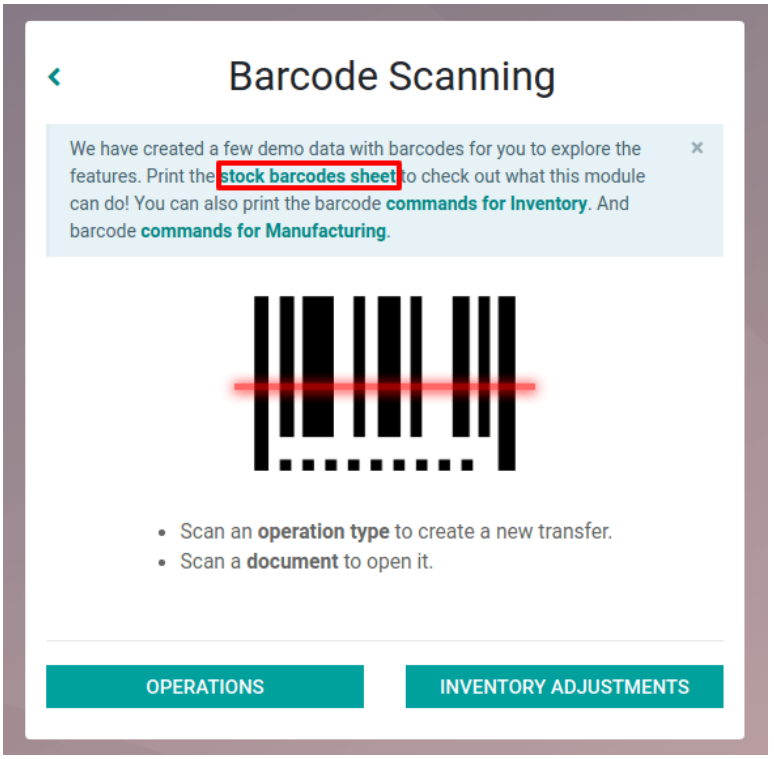


- If you have the same lot/serial number for different products, you can work by scanning the product barcode first, and then the barcode of the lot/serial number.

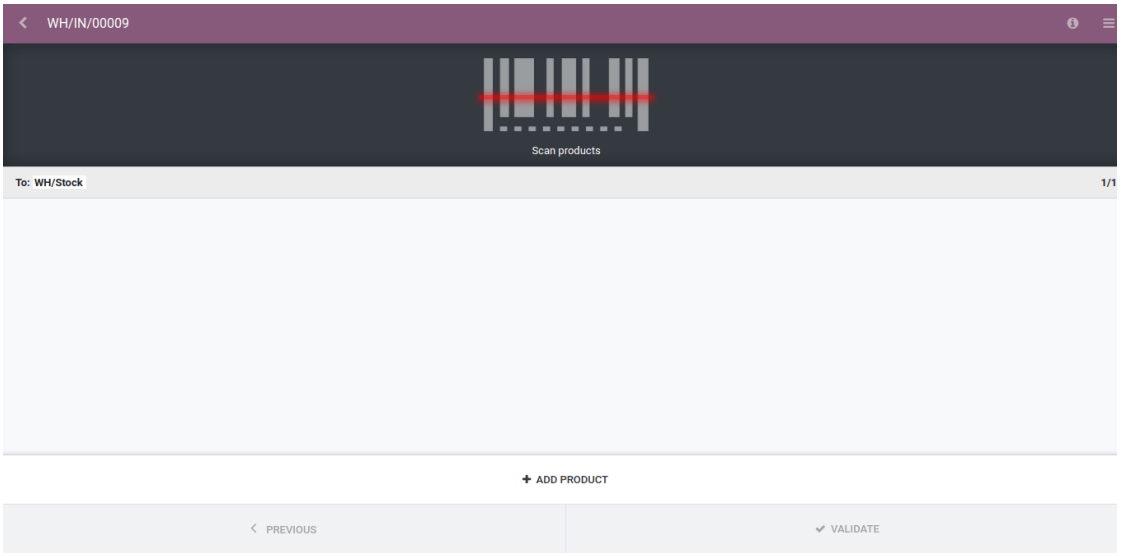


13.3. Create a transfer to a scratch

To create a transfer from the *Barcode* application, you first need to print the operation type barcodes. To do so, you can download the *Stock barcode sheet* from the home page of the app.



Once done, you can scan the one for which you want to create a new document. Then, an empty document will be created and you will be able to scan your products to populate it.

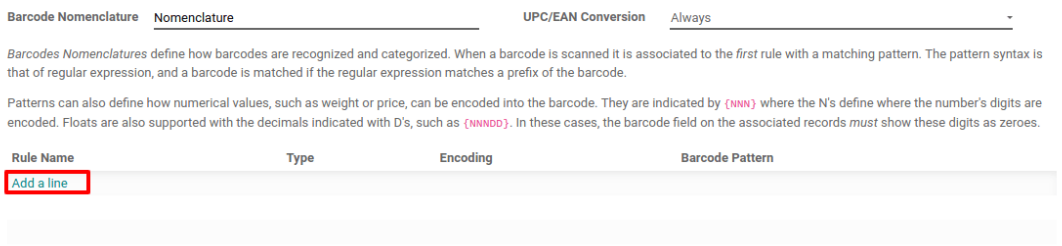


13.4. Overview

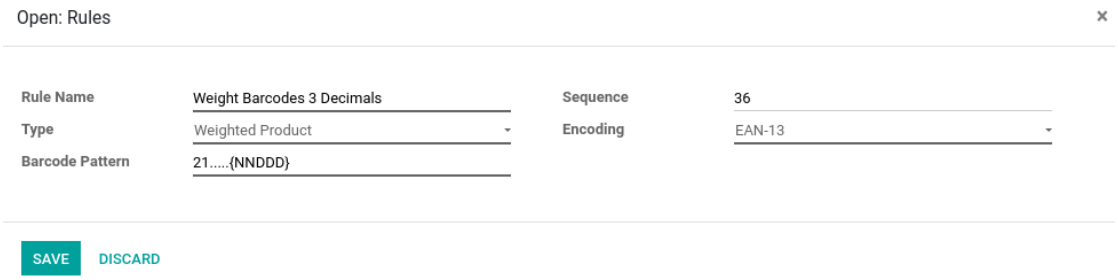
13.4.1. Create a nomenclature

system supports Barcode Nomenclatures, which determine the mapping and interpretation of the encoded information. You can configure your barcode nomenclature being in developer mode. To do so, go to Inventory > Configuration > Barcode Nomenclature.

You can create a barcode nomenclature from there, and then add a line to create your first rule.



The first step is to specify the **rule name**, for example Weight Barcode with 3 Decimals. You then have to specify the type for barcode nomenclature, in our case it will be Weighted Product.

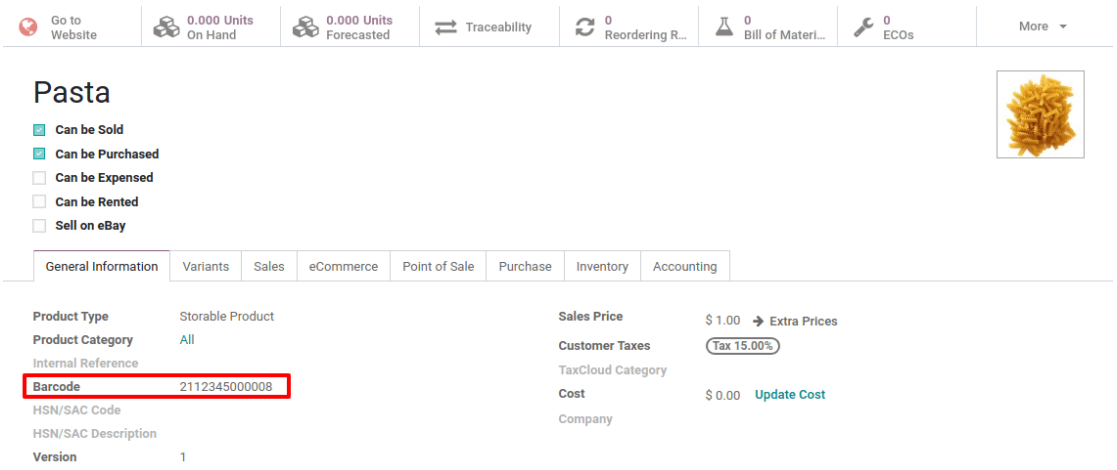


The Barcode Pattern is a regular expression that defines the structure of the barcode. In this example 21 defines the products on which the rule will be applied, those are the

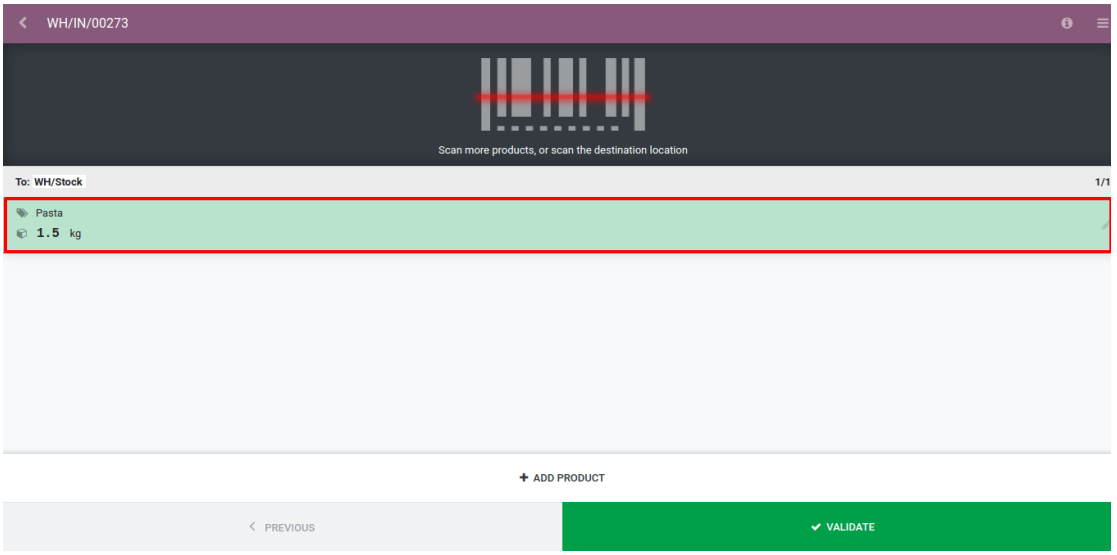
numbers by which the product barcode should start. The 5 “dots” are the following numbers of the product barcode and are there simply to identify the product in question. The “N” define a number and the “D” define the decimals.
The encoding allows to specify the barcode encoding on which the rule should be applied.

13.4.2. Configure your product

1. The barcode of the product should start by “21”;
2. The 5 “dots” are the other numbers of your product barcode, allowing to identify the product;
3. The barcode should contain 0’s where you did defined D’s or N’s. In our case we need to set 5 zeros because we configured “21…..{NNDDD}”;
4. In EAN-13, the last number is a check number, use an EAN13 generator to know which digit it should be in your case.



In case you weight 1,5 Kg of pasta, the balance will print you the following barcode 2112345015002. If you scan this barcode in your POS or when receiving products in your barcode application, system will automatically create a new line for the Pasta product for a quantity of 1.5 Kg. For the point of sale, a price depending on the quantity will also be computed.



13.4.3. Rules types

- **Priced Product**: allows you to identify the product and specify its price, used in POS.
- **Discounted Product**: allows you to create one barcode per applied discount. You can then scan your product in the POS and then scan the discount barcode, discount will be applied on the normal price of the product.
- **Weighted Product**: allows you to identify the product and specify its weight, used in both POS (in which the price is computed based on the weight) and in inventory.
- **Client**: allows you to identify the customer, for example used with loyalty program.
- **Cashier**: allows you to identify the cashier when entering the POS.
- **Location**: allows you to identify the location on a transfer when multi-location is activated.
- **Package**: allows you to identify packages on a transfer when packages are activated.
- **Credit Card**: doesn't need manual modification, exists for data from the Mercury module.
- **Unit Product**: allows you to identify a product for both POS and transfers.

13.5. GS1 Barcode Nomenclature

13.5.1. Product + Quantity + Lot

To build a GS1 barcode for a box that contains a product, number of units in it, and the lot number, the following barcode patterns are used:

Name	Rule Name	Barcode Pattern	Field in system
Product	Global Trade Item Number (GTIN)	(01)(\d{14})	Barcode field on product form

Quantity	Variable count of items	(30)(\d{0,8})	Units field on transfer form
Lot Number	Batch or lot number	(10)([!"%-/0-9:-?A-Z_a-z]{0,20})	Lot on Detailed Operations pop-up

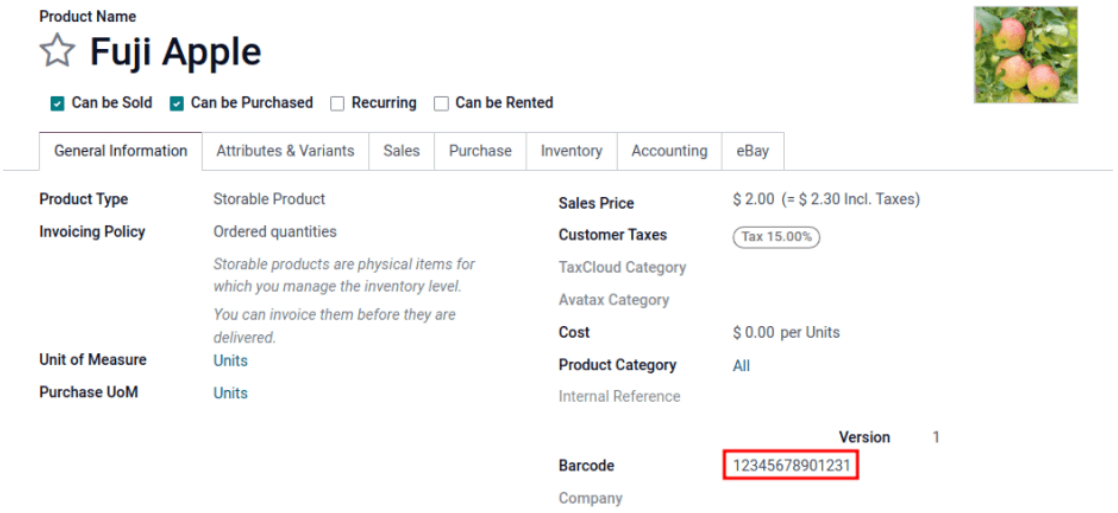
13.5.1.1 Configuration

To track products using lots, first enable the Lots and Serial Numbers feature. To do so, navigate to Inventory app > Configuration > Settings. Next, under the Traceability heading, check the box for Lots & Serial Numbers.

Then, set up the product barcode by navigating to the intended product form in Inventory app > Products > Products and selecting the product. On the product form, click Edit. Then, in the General Information tab, fill in the Barcode field with the 14-digit Global Trade Item Number (GTIN), which is a universal and unique identifying number from GS1.

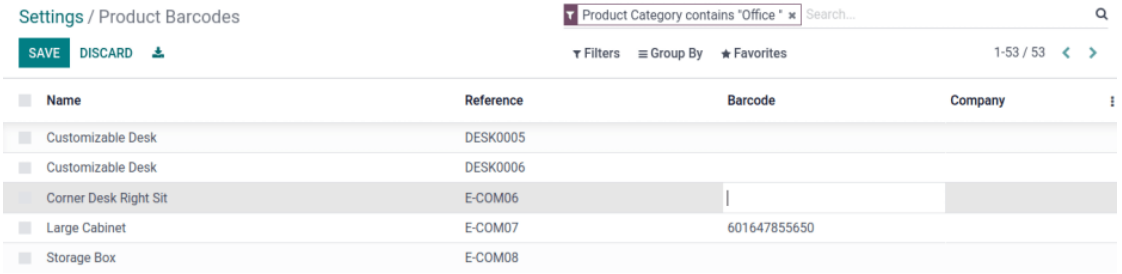
Example :

To create a barcode for the product, Fuji Apple, enter the 14-digit GTIN 12345678901231 in the Barcode field on the product form.

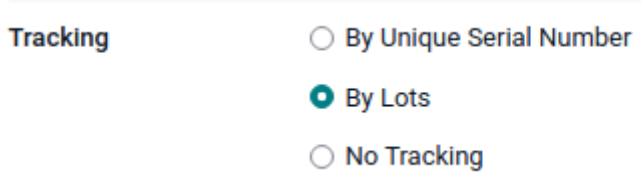


It is also possible to view a list of all products and barcodes. To access this list, go to Inventory > Configuration > Settings. Under the Barcode heading, click on the Configure Product Barcodes button under the Barcode Scanner section. Enter the

14-digit GTIN into the Barcode column, then click Save.



Next, enable lots and serial number tracking on the product. Select the Inventory tab on the product form. Under Tracking, choose the By Lots radio button.



13.5.1.1 Scan barcode on receipt

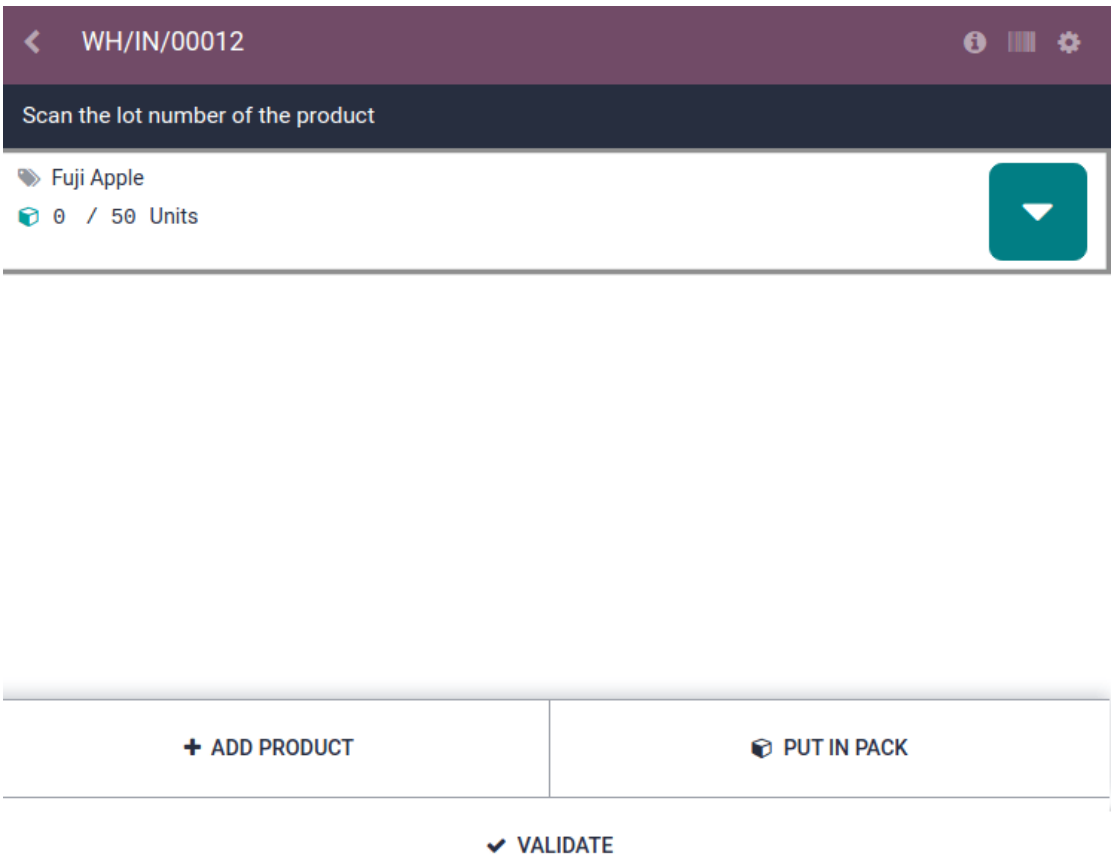
To ensure accurate lot interpretation in system on product barcodes scanned during a receipt operation, navigate to the Barcode app to manage the receipt picking process.

From the Barcode Scanning dashboard, click the Operations button, then the Receipts button to view the list of vendor receptions to process. Receipts generated from POs are listed, but new receipt operations can also be created directly through the Barcode app using the Create button.

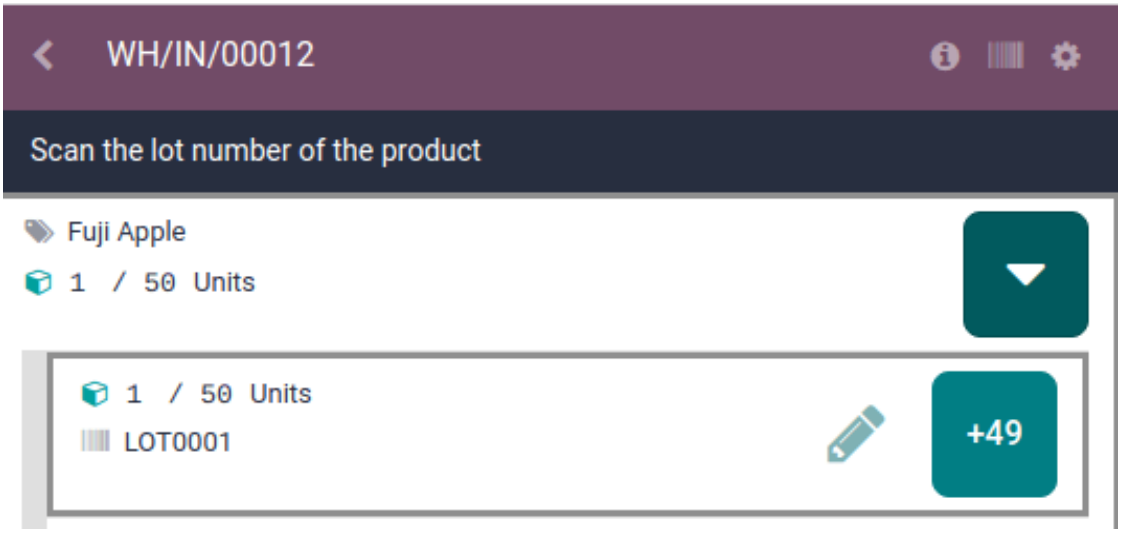
On the list of receipts, click on the warehouse operation (WH/IN) and scan product barcodes and lot numbers with a barcode scanner. The scanned product then appears on the list. Use the ✏️ (pencil) button to open a window and manually enter quantities for specific lot numbers.

Example :

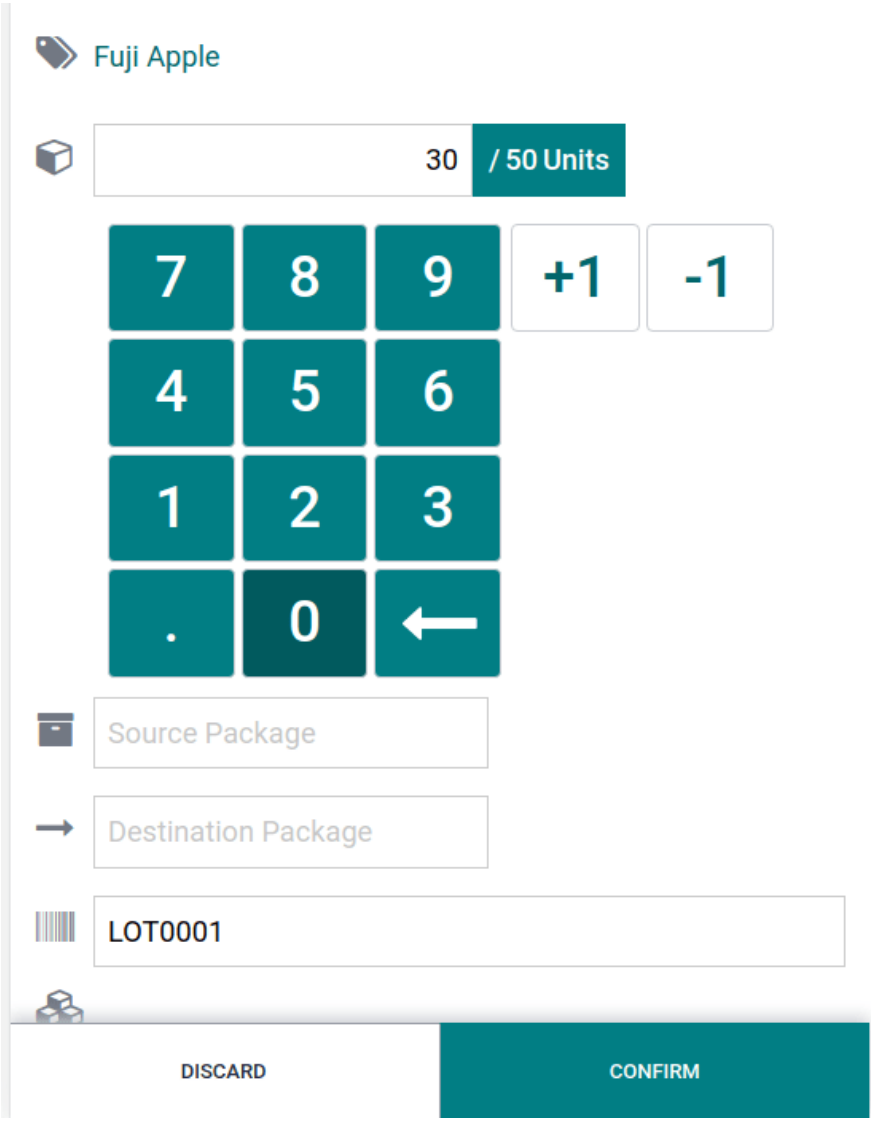
After placing a PO for 50 apples, navigate to the associated receipt. Scan the product barcode, and system will prompt for the lot number.



Scan the lot number to process 1 of 50 apples. To avoid scanning 49 remaining barcodes, click the ✏️ (pencil) button next to the desired lot number.



Doing so opens a mobile-friendly keypad page to specify received quantities. Use the keypad to specify the Units for the lot number. When finished, click Confirm.



Repeat this process to specify additional lot numbers and quantities in this receipt. Once the Units are all accounted for, finish the reception by clicking the Validate button. Alternatively, scan the barcode containing the product, lot number, and quantity to complete the receipt operation in fewer steps.

13.5.2. Product + Non-unit + Lot

To build a GS1 barcode that contains products measured in a non-unit quantity, like kilograms, for example, the following barcode patterns are used:

Name	Rule Name	A.I.	Barcode Pattern	Field in system
Product	Global Trade Item Number (GTIN)	01	(01)(\d{14})	Barcode field on product form

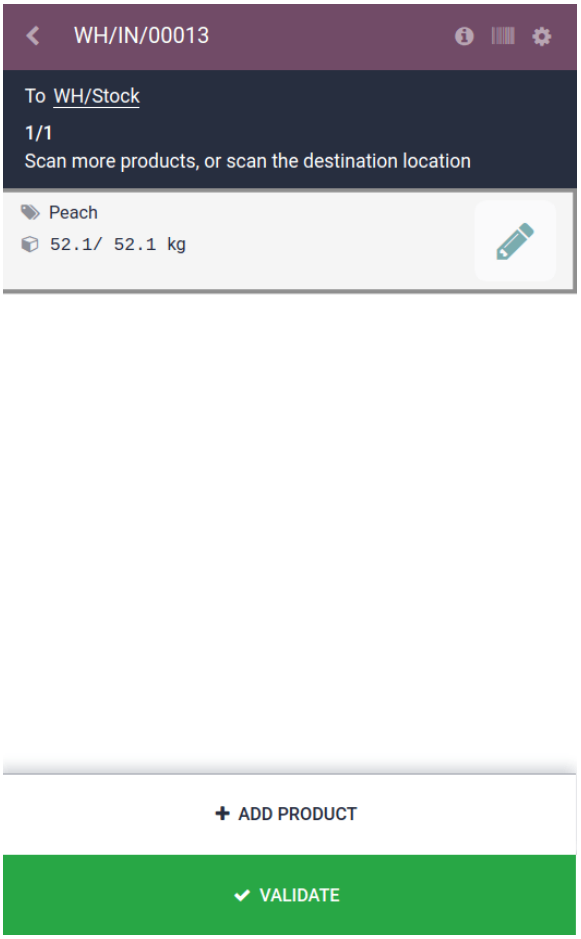
Quantity in kilograms	Variable count of items	310[0-5]	(310[0-5])(\d{6})	Units field on transfer form

13.5.2.1 Scan barcode on receipt

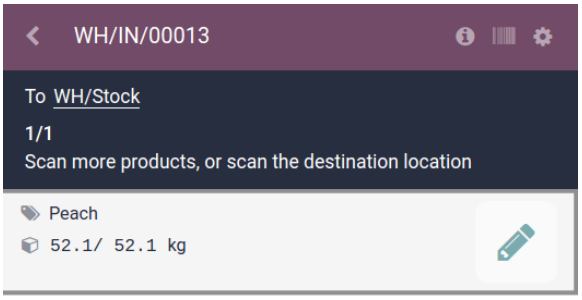
To confirm that quantities are correctly interpreted in system, place an order in the *Purchase* app using the appropriate unit of measure (UoM) for the quantity of products to be purchased.

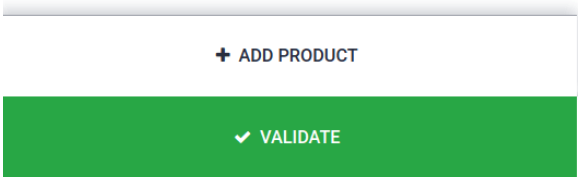
Example :
On the receipt in the *Barcode* app, receive an order for 52.1 kg of peaches by scanning the barcode. If 52.1 / 52.1 kg appears on the page, this means the reception was processed without issue. Finally, press Validate.

Note: the A.I. for kilograms, 310 + 1, was used to represent 52.1 kg as a barcode: 000521. This is because the 1 represents how many digits from the right to place the decimal point.



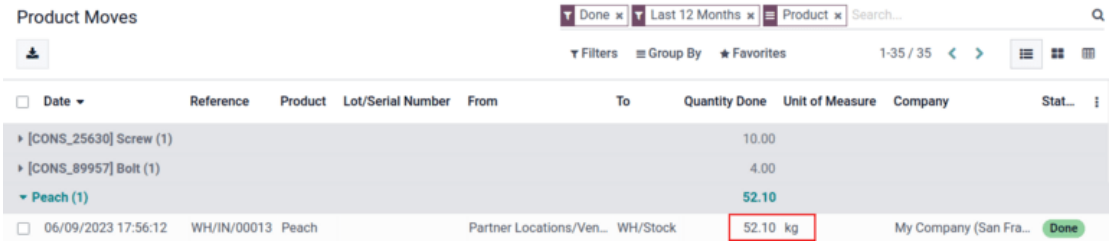
WH/IN/00013
To WH/Stock
1/1
Scan more products, or scan the destination location
Peach
52.1/ 52.1 kg
+ ADD PRODUCT
VALIDATE





For additional verification purposes, the quantities of received products are also recorded on the Product Moves report, accessible by navigating to Inventory app > Reporting > Product Moves.

The items on the Product Moves report are grouped by product by default. To confirm the received quantities, click on a product line to open its collapsible drop-down menu, which displays a list of *stock move lines* for the product. The latest stock move matches the warehouse reception reference number (e.g. WH/IN/00013) and quantity processed in the barcode scan, demonstrating that the records processed in the *Barcode* app were properly stored in *Inventory*.



15.5.2.2 Create Rules

If a supplier uses a GS1 barcode with a field not supported by system's default GS1 list, system will fail to interpret the entire barcode. To ensure the complete reading of the barcode, it is necessary to add the missing barcode to system's list.

Begin by turning on developer mode and navigating to the Barcode Nomenclatures list in Inventory app > Configuration > Barcode Nomenclatures. Then, select the Default GS1 Nomenclature list item.
On the Default GS1 Nomenclature page, select Add a line at the bottom of the table, which opens a window to create a new rule. The Rule Name field is used internally to identify what the barcode represents. The barcode Types are different classifications of information that can be understood by the system (e.g. product, quantity, best before date, package, coupon). The Sequence represents the priority of the rule; this means the smaller the value, the higher the rule appears on the table. system follows the sequential order of this table and will use the first rule it matches based on the sequence. The Barcode Pattern is how the sequence of letters or numbers is recognized by the system to contain information about the product.
After filling in the information, click the Save & New button to make another rule or click Save & Close to save and return to the table of rules.

13.5.3. Barcode Troubleshooting

Since GS1 barcodes are challenging to work with, here are some checks to try when the barcodes are not working as expected:

1. Ensure that the Barcode Nomenclature setting is set as Default GS1 Nomenclature. Jump to the nomenclature setup section for more details.
2. Ensure that the fields scanned in the barcode are enabled in system. For example, to scan a barcode containing lots and serial numbers, make sure the Lots & Serial Numbers feature is enabled in system's settings and on the product.
3. Omit punctuation such as parentheses () or brackets [] between the A.I. and the barcode sequence. These are typically used in examples for ease of reading and should not be included in the final barcode. For more details on building GS1 barcodes, go to this section.
4. When a single barcode contains multiple encoded fields, system requires all rules to be listed in the barcode nomenclature for system to read the barcode. This section details how to add new rules in the barcode nomenclature.

13.5.4. GS1 Nomenclature list

The table below contains system's default list of GS1 rules. Barcode patterns are written in regular expressions. Only the first three rules require a check digit as the final character.

Rule Name	**Type**	**Barcode Pattern**	**GS1 Content Type**	**system field**
Serial Shipping Container Code	Package	(00)(\d{18})	Numeric identifier	Package name

	Global Trade Item Number (GTIN)	Unit Product	(01)(\d{14})	Numeric identifier	Barcode field on product form
	GTIN of contained trade items	Unit Product	(02)(\d{14})	Numeric identifier	Packaging
	Ship to / Deliver to global location	Destination location	(410)(\d{13})	Numeric identifier	Destination location
	Ship / Deliver for forward	Destination location	(413)(\d{13})	Numeric identifier	Source location

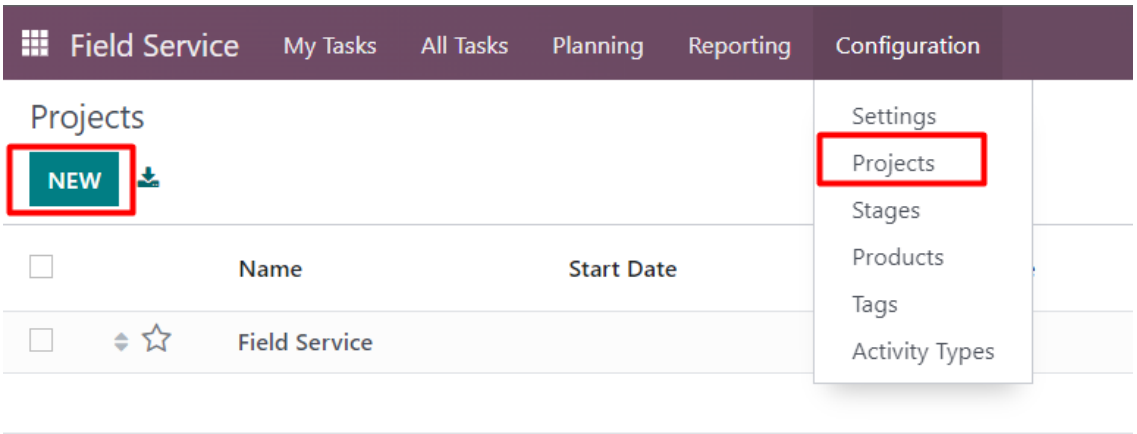
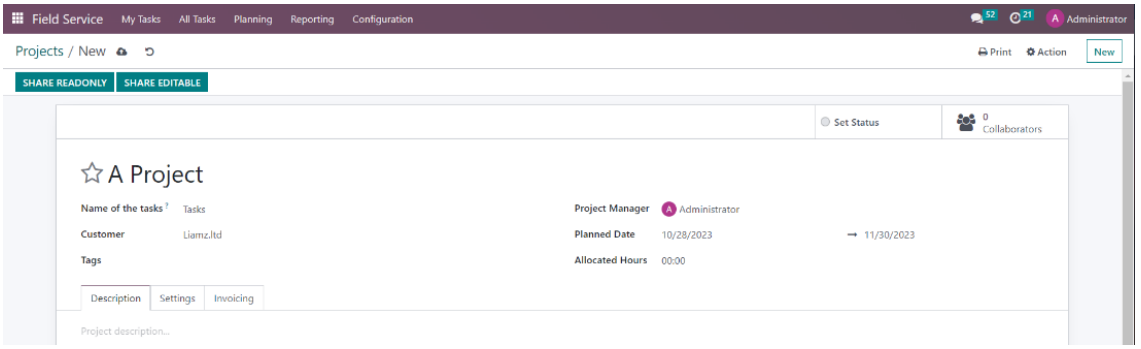
	Net volume: cubic feet (ft^3)	Quantity	(365[0-5])(\d{6})	Measure	Qty in ft^3
	Packaging type	Packaging Type	(91)([!"%-/0-9:-?A-Z_a-z]{0,90})	Alpha-numeric name	Package type

14. Field service

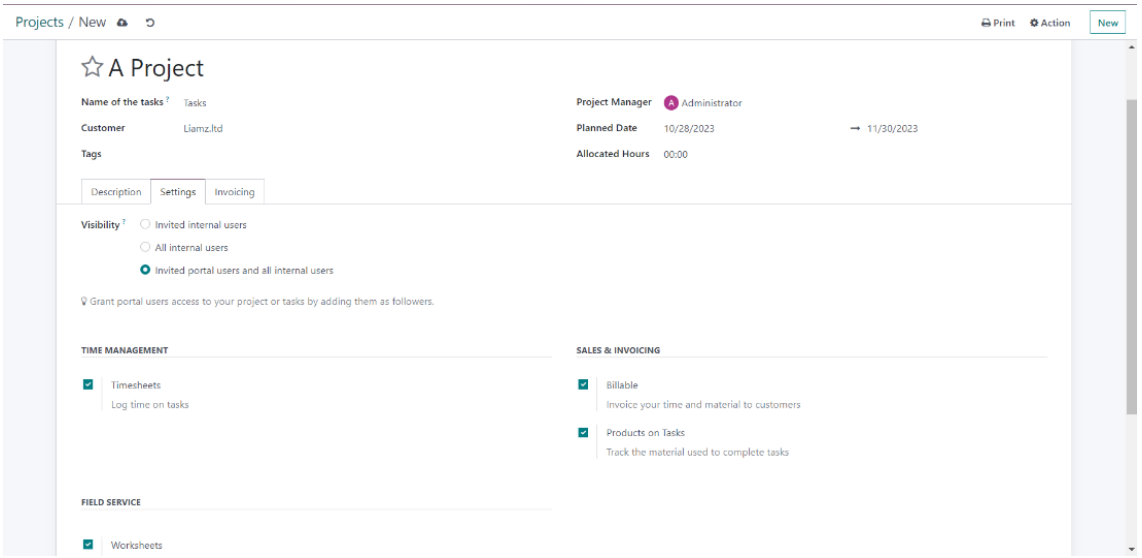
14.1. Creating a project



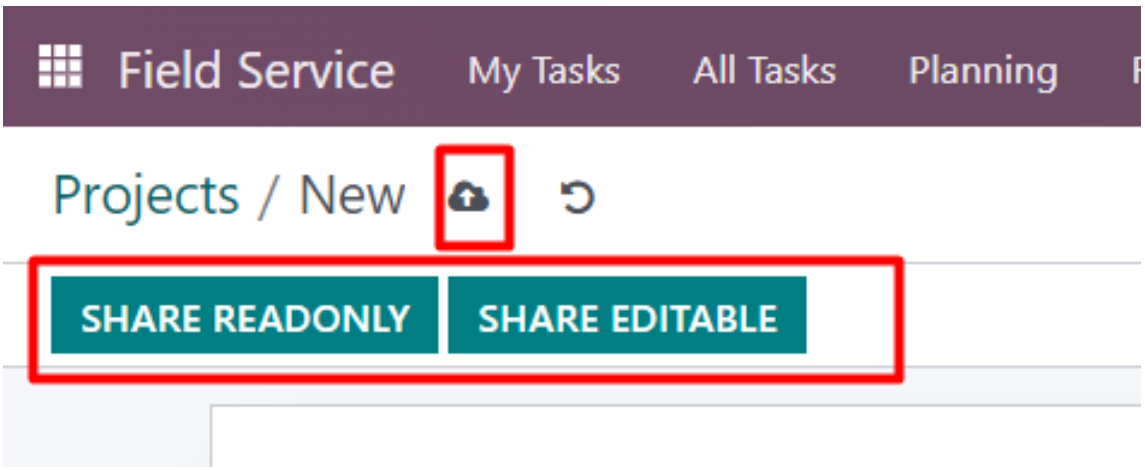
We can create a new project by open the Field service Module, click on configuration>Project and click on create button



Fill in the project detail to describe the project

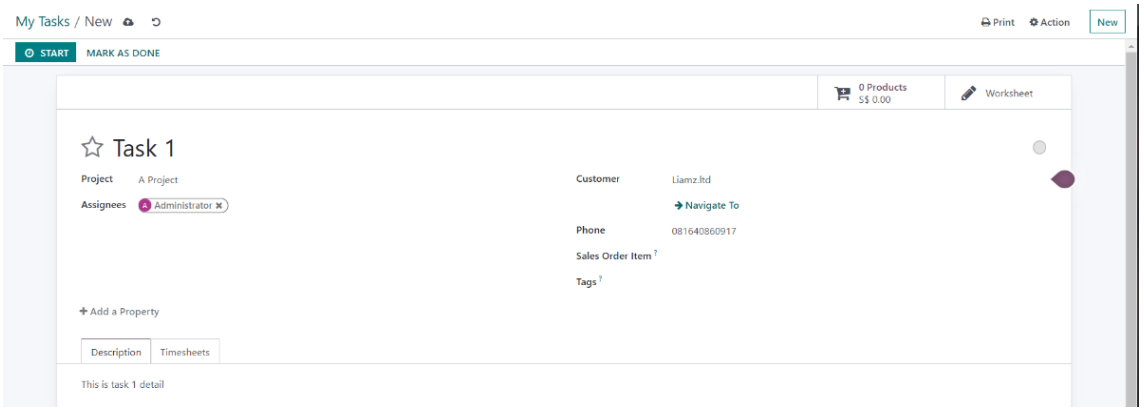


Setting bar will allow user to fill in the PIC detail and visibily of project also multi company for multi company and configuration to allow timesheet, timer etc

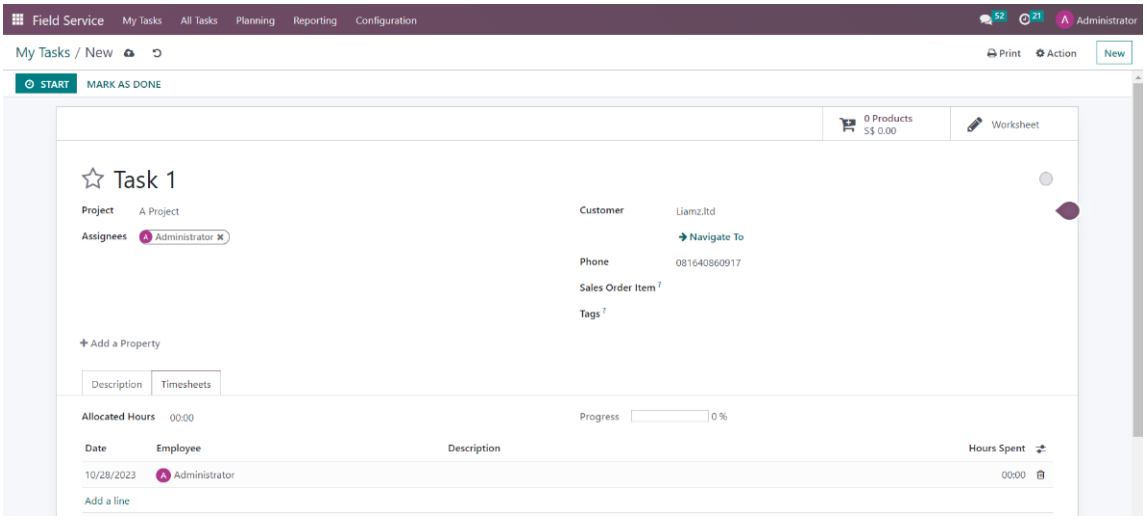


After filling in the detail, we can save and share the project

14.2. Creating a Task



Fill in the detail of the task

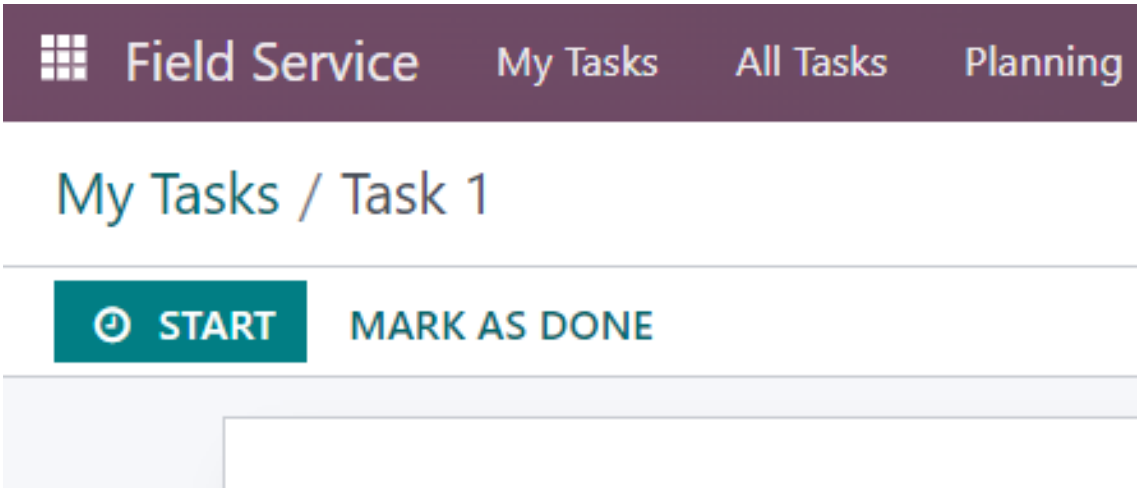


We can add timesheet and see the duration in timesheet bar

14.3. Other views

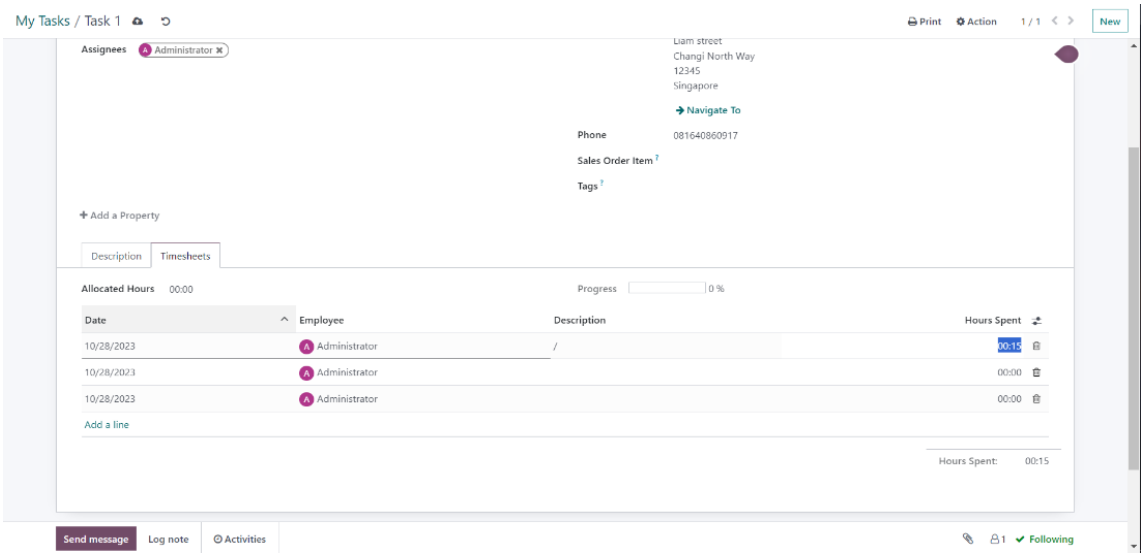
There’s Kanban view, Map, Calender, List, Gantt and Activity view available

14.4. Timer



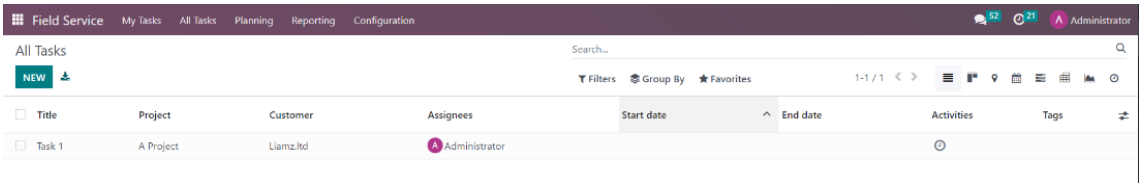
Timer here’s to track time used while doing the task, we can pause or stop, if finished then mark as done

14.5. Editing time



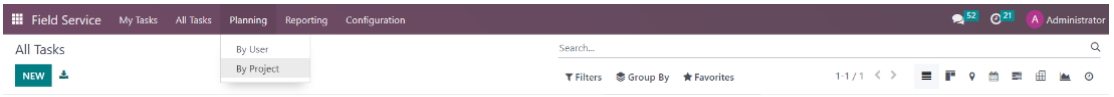
We can edit timesheet time by click on edit and edit the time according to what we want

14.6. Managing Task



We can manage the task by going to all task bar, check the task to schedule or invoice, to further make it easier, we may filter and grouping according our needs such as time, date etc

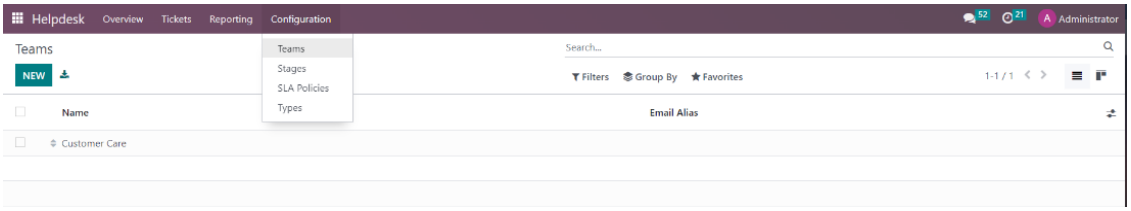
14.7. Planning Task

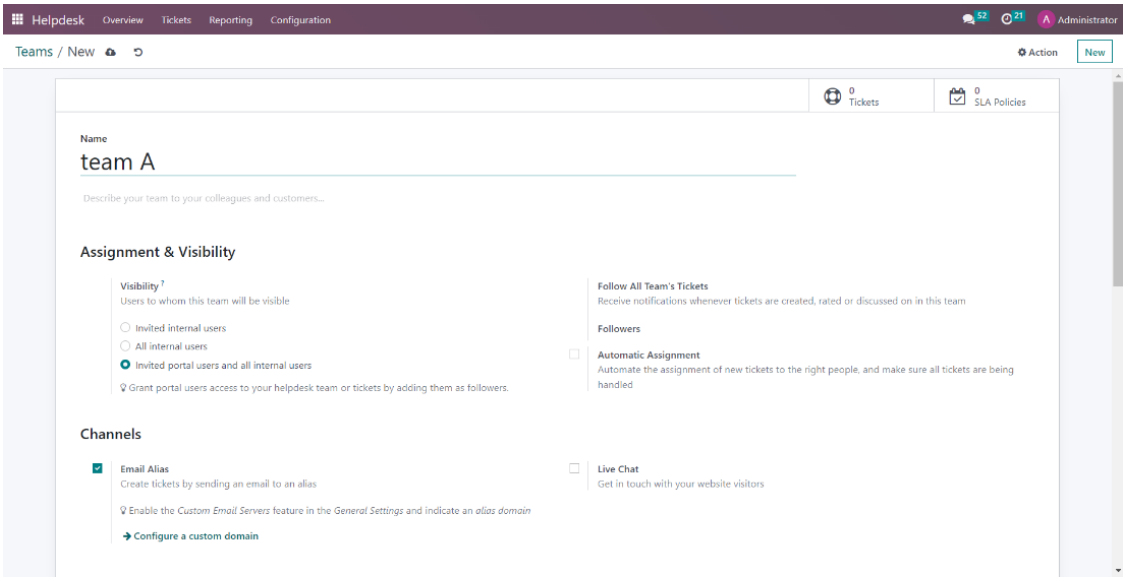


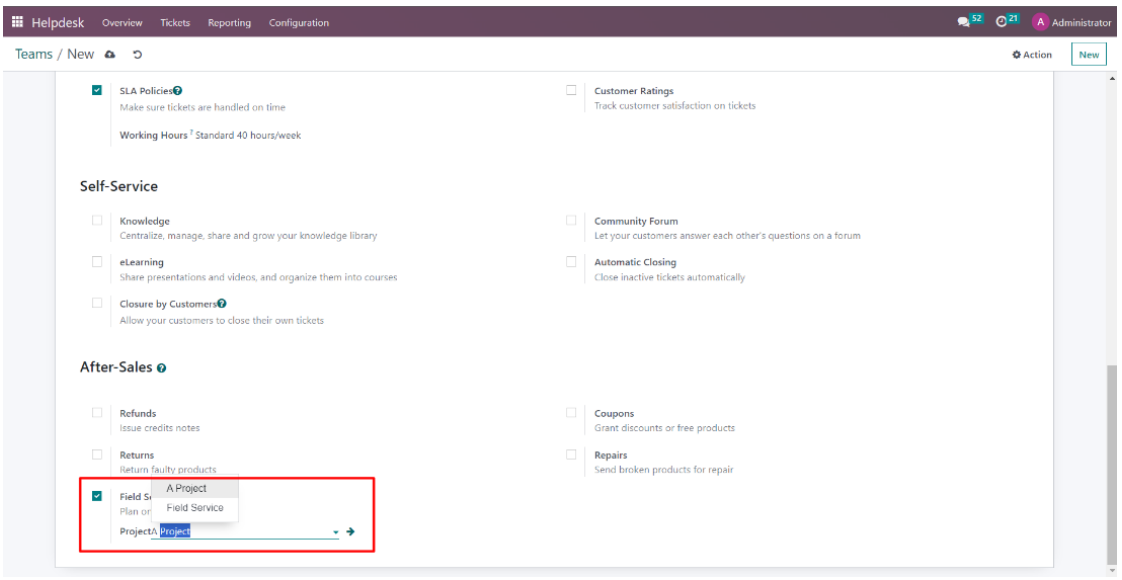
We had 2 view to control the task, by user which we can see who the task was assigned and by project

15. Help Desk

15.1. Helpdesk Team

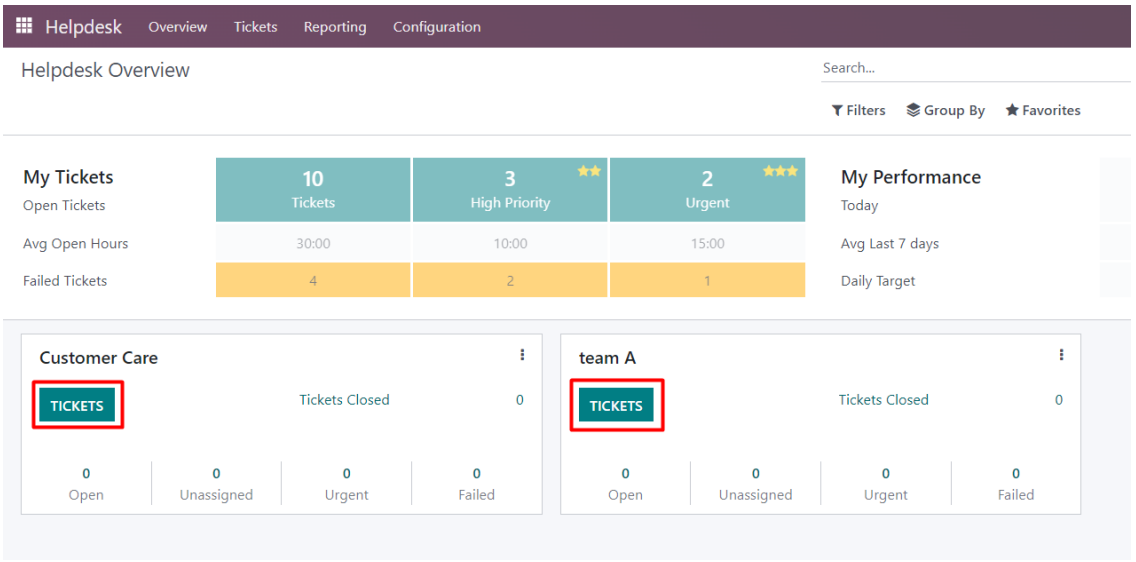






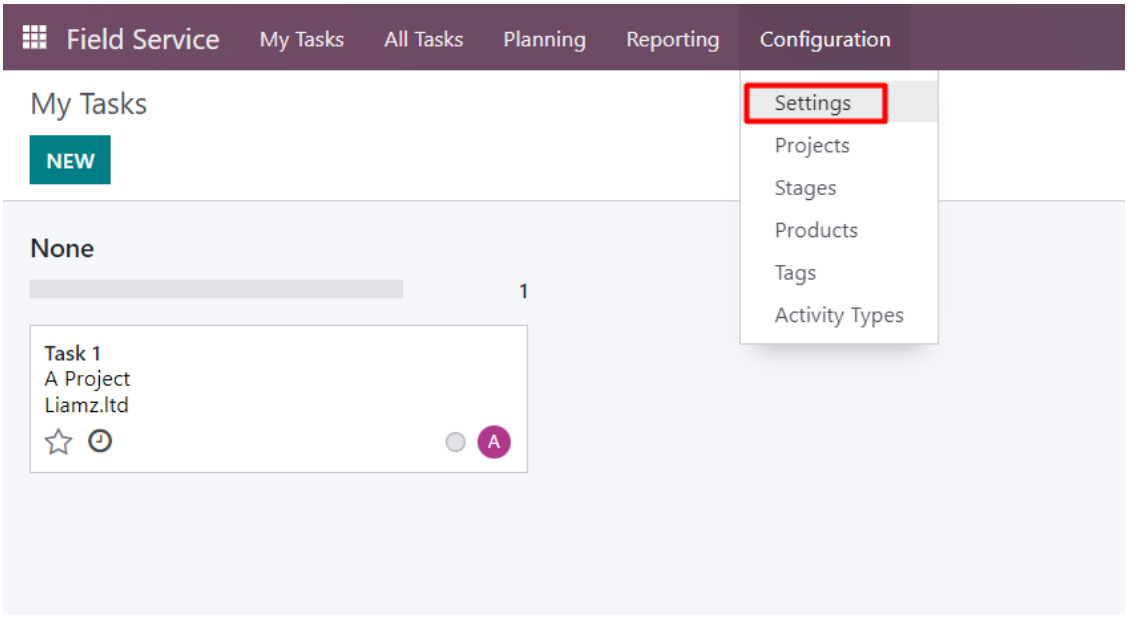
We can create new helpdesk team by going to configuration>helpdesk team>create>Save after key in the team name and tick the onsite intervention to make ticket able to link with task

15.2. Helpdesk Overview

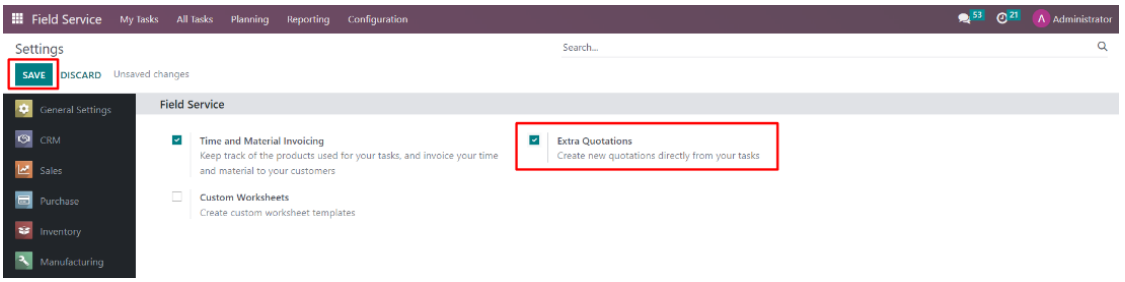


We can see the ticket that was allocated in helpdesk overview

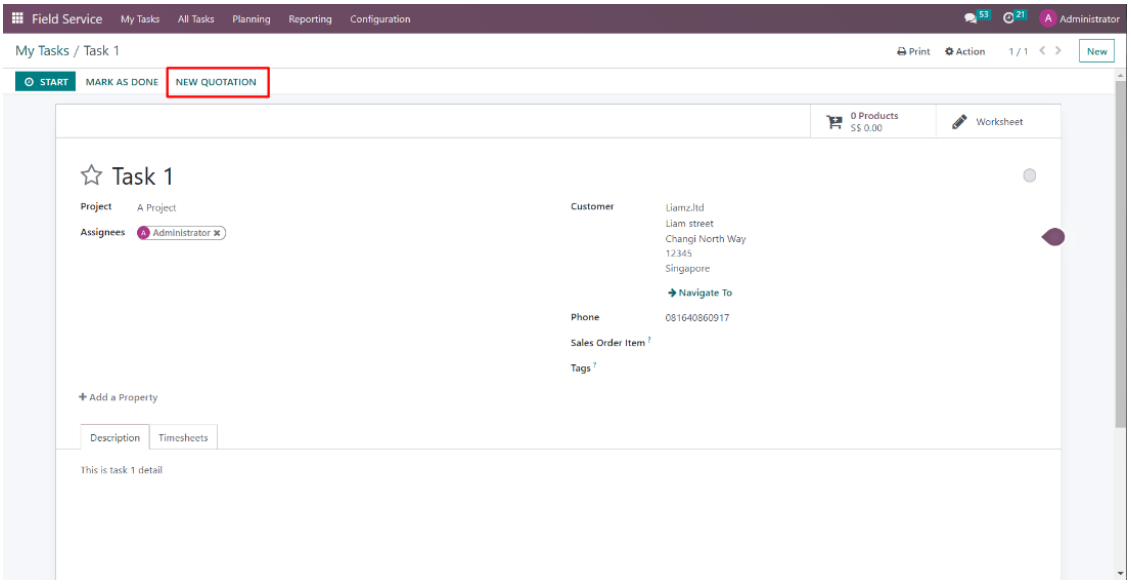
15.3. Create Quotation on site



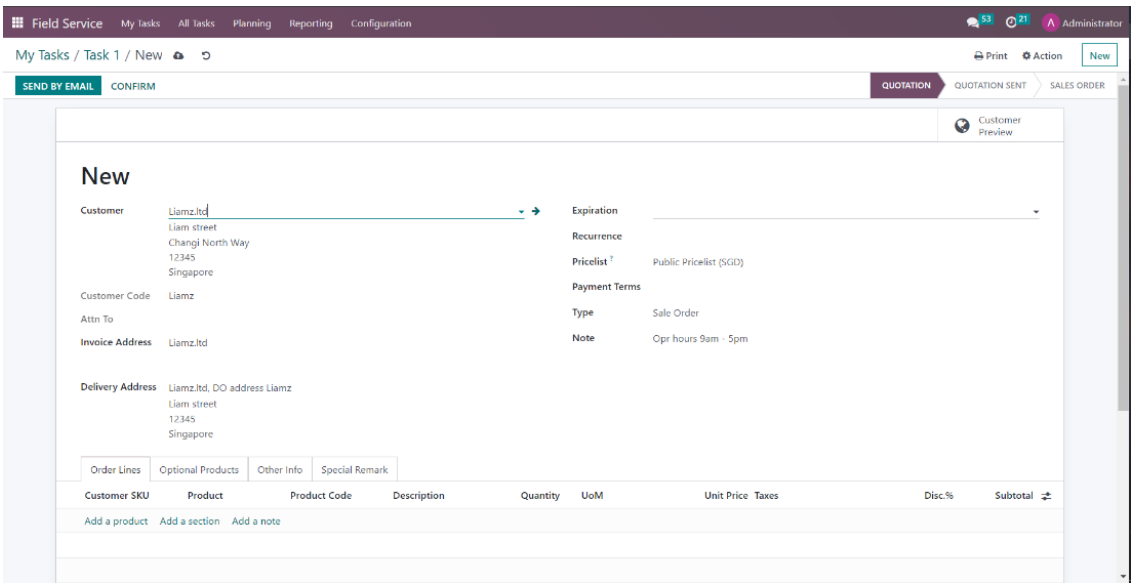
To open the configuration feature, we must go to field service>configuration>settings



Tick the extra quotation and save to activate the feature

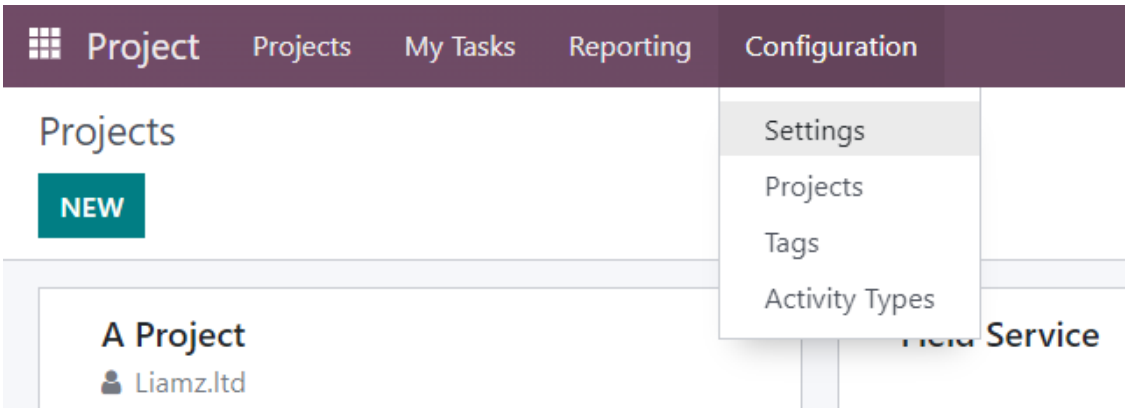


Now we’re able to create a new quotation directly in task

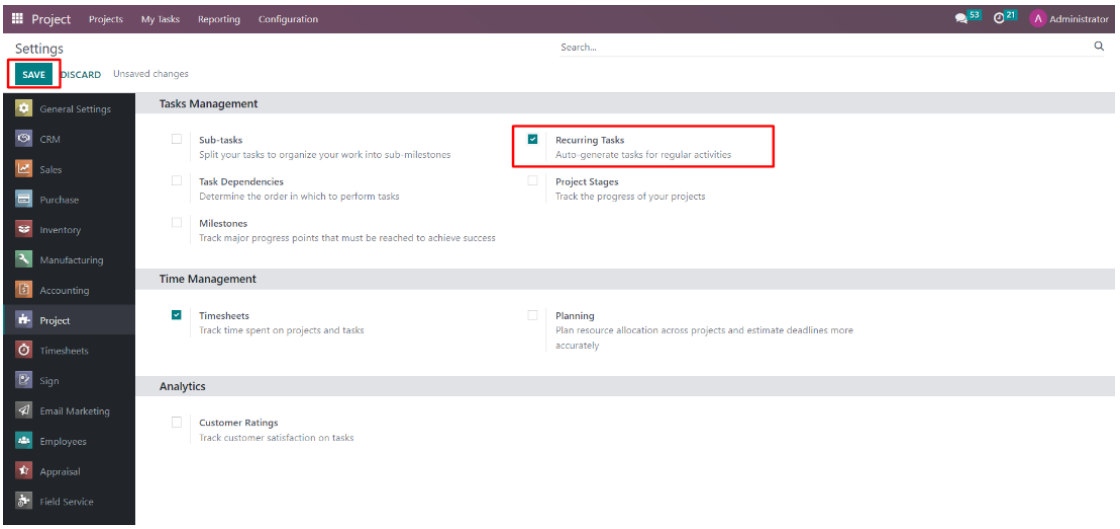


Fill in the product and confirm the quotation to create sales order

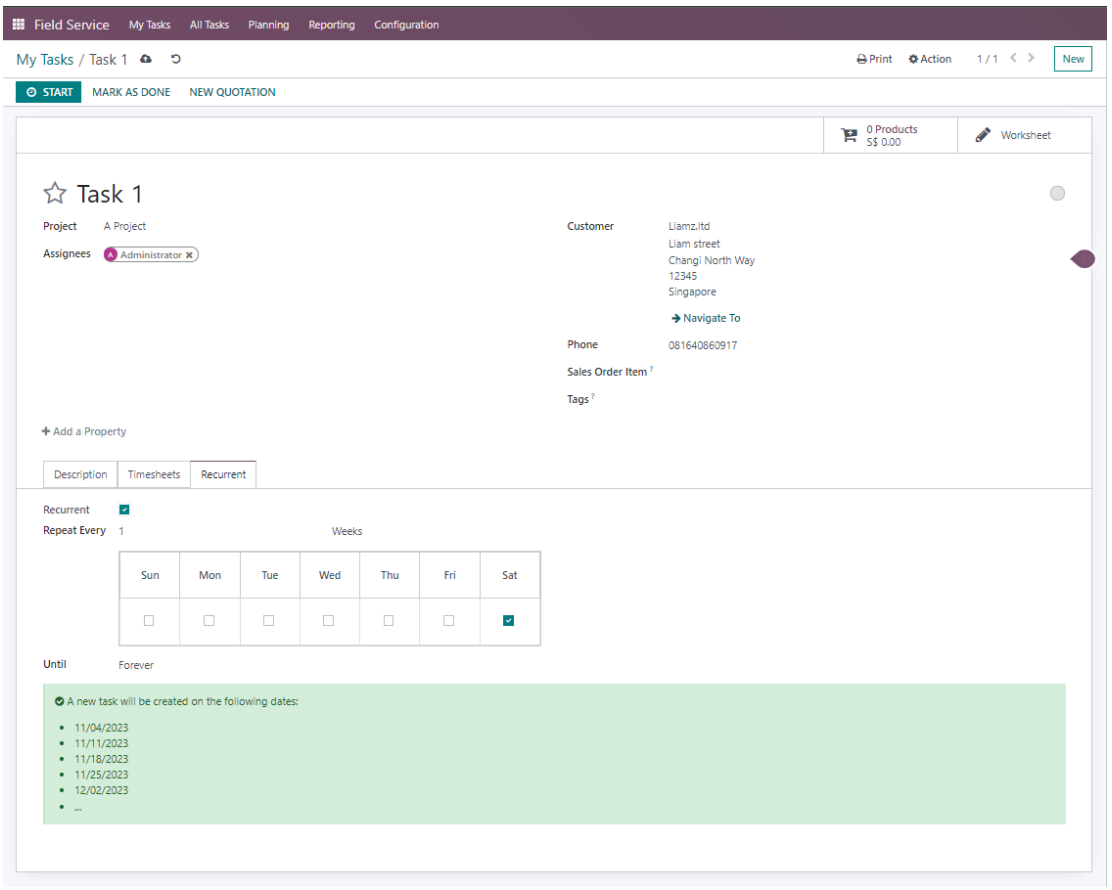
15.4. Recurring Task



To set the recuring, we must go to project configuration and setting



Tick on recurring task and save to activate it



Now we are able to set task and configure the frequency of recurring
